A Journey From Pure Math to Skin Cancer Detection

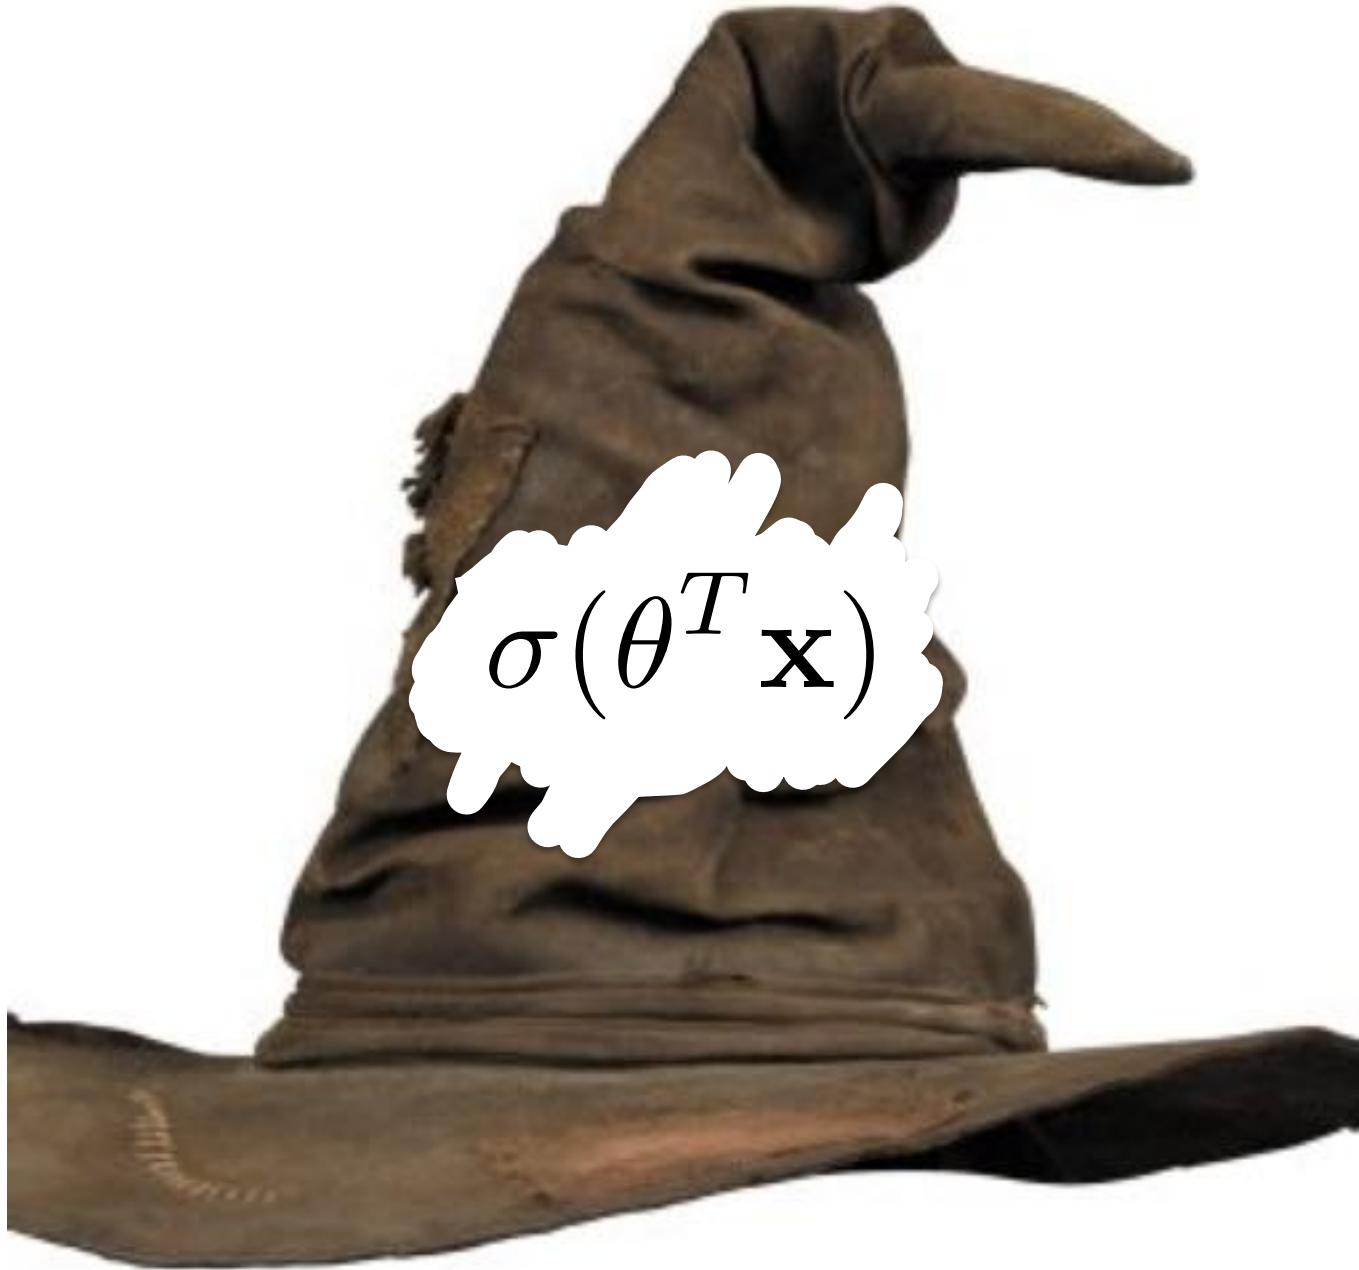

Logistic Regression is like the Harry Pottery Sorting Hat

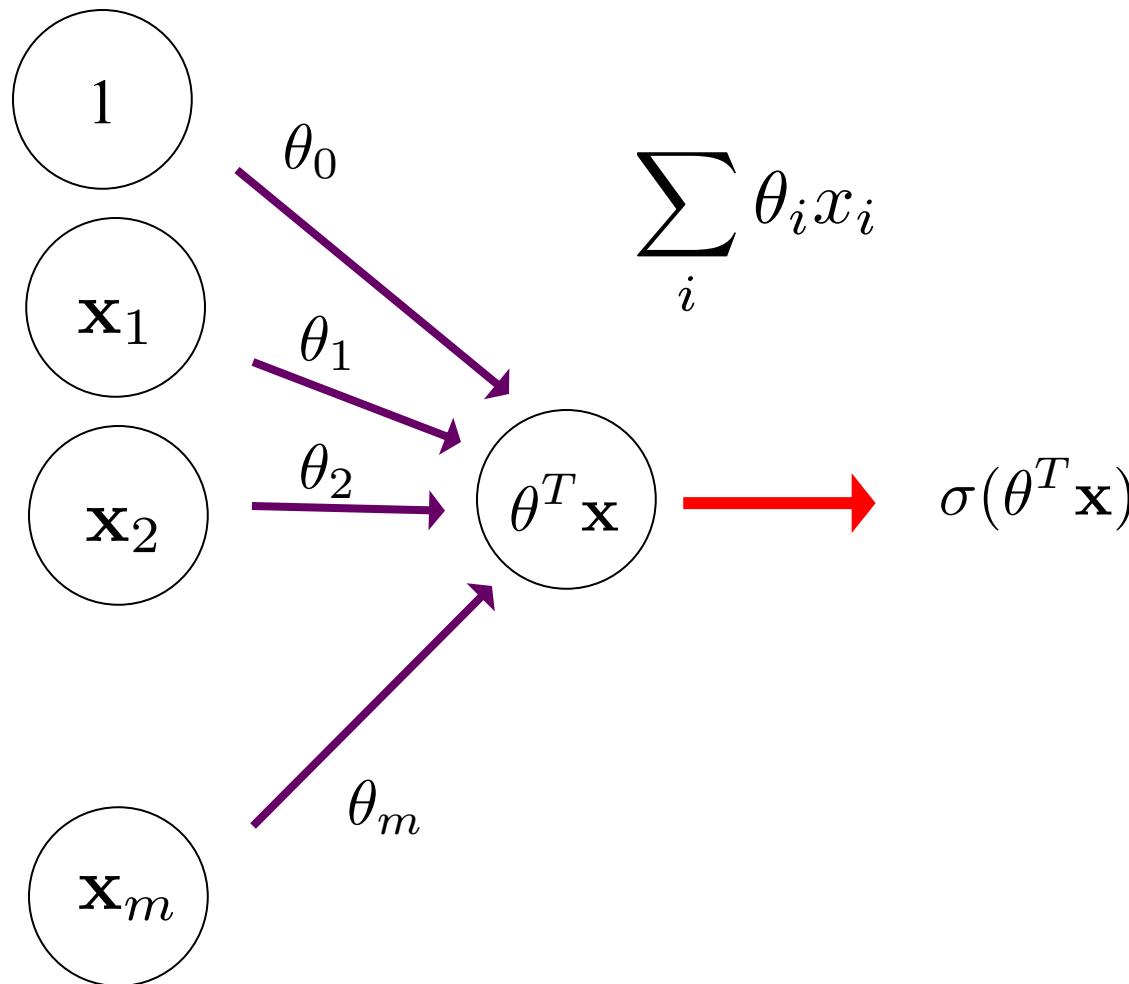

$$P(Y = 1) = 0.91$$

X

Logistic Regression is like the Harry Pottery Sorting Hat

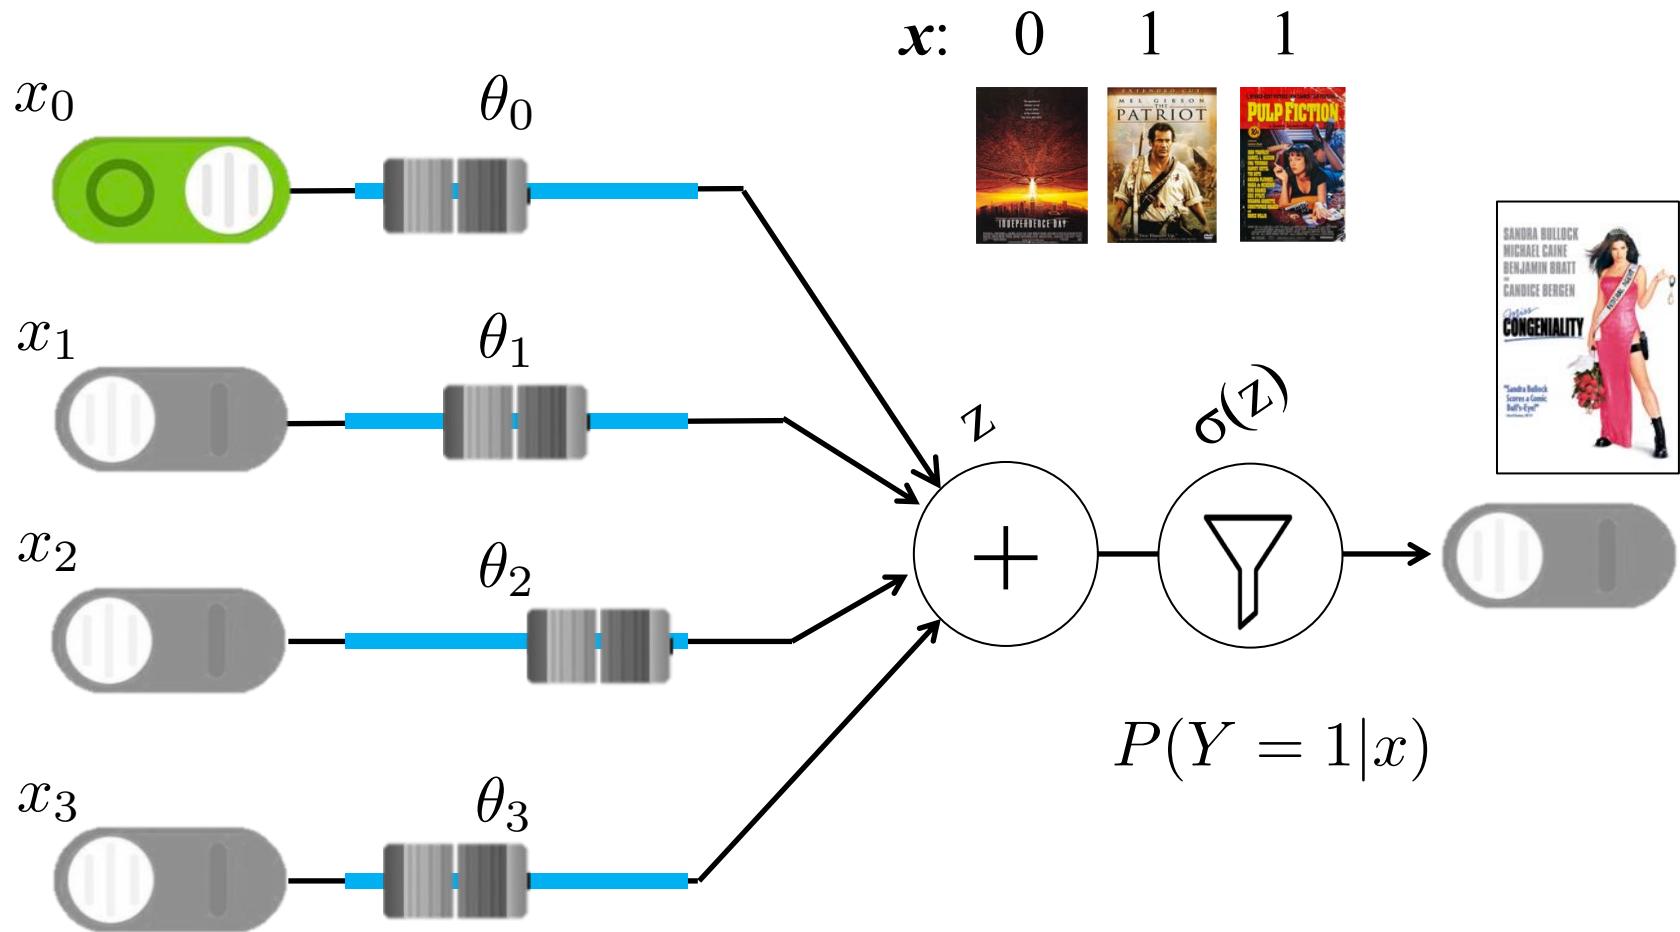

Logistic Regression

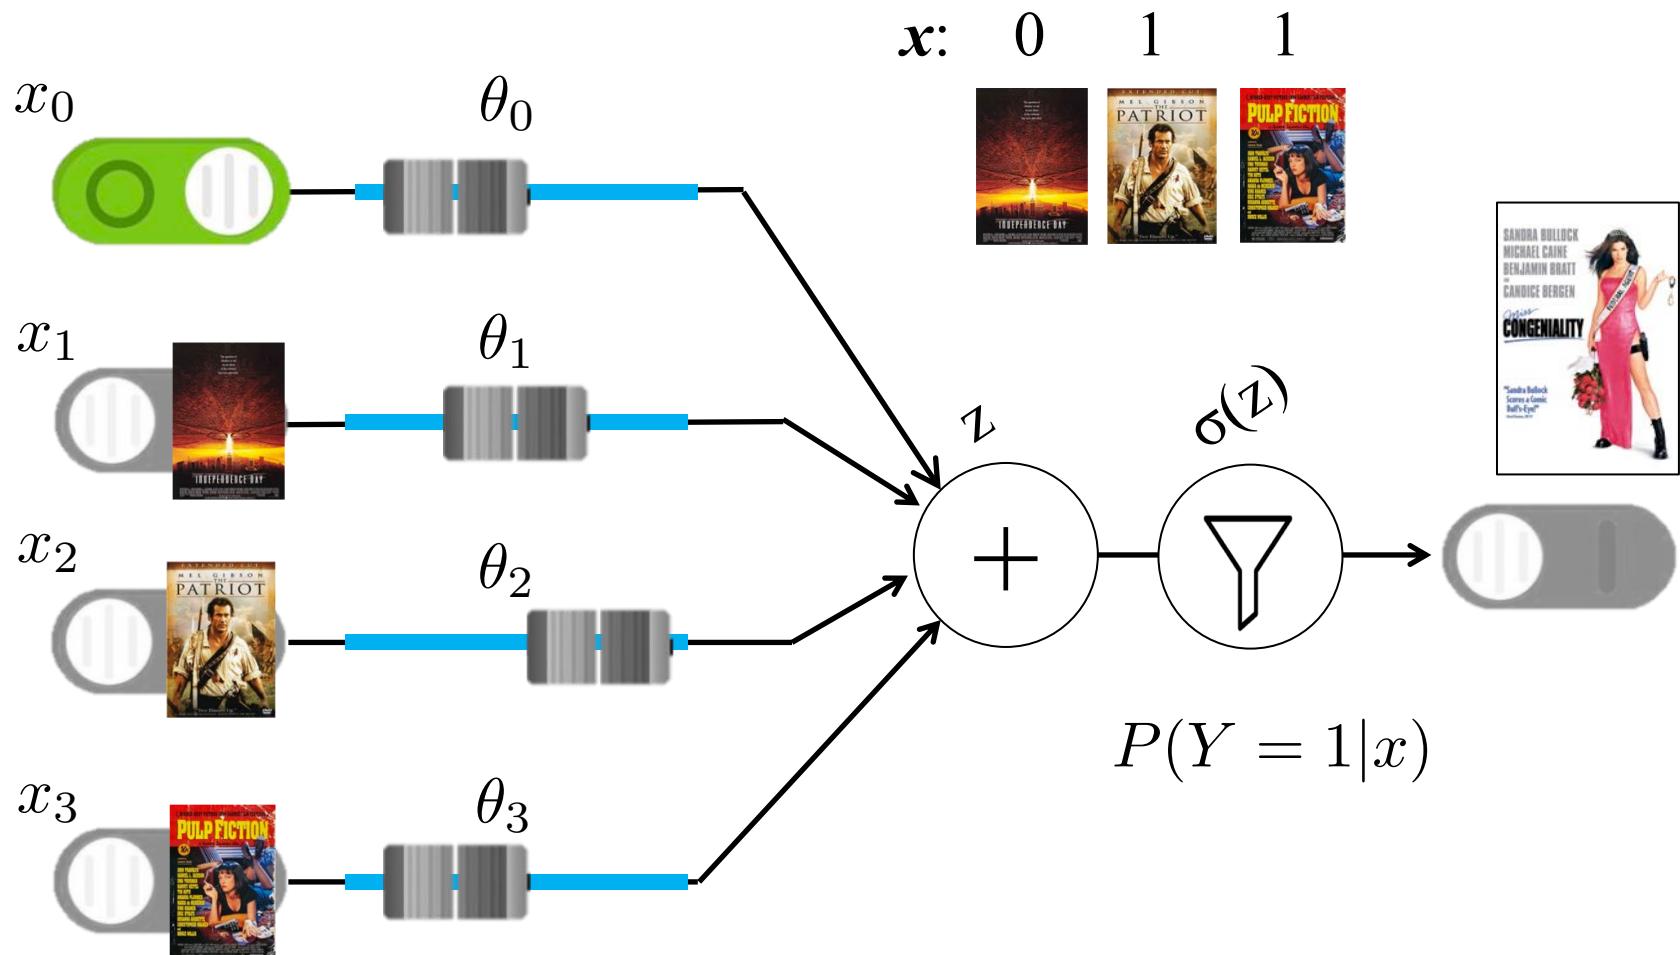

$$P(Y = 1 | X = \mathbf{x}) = \sigma(\theta^T \mathbf{x})$$

Logistic Regression

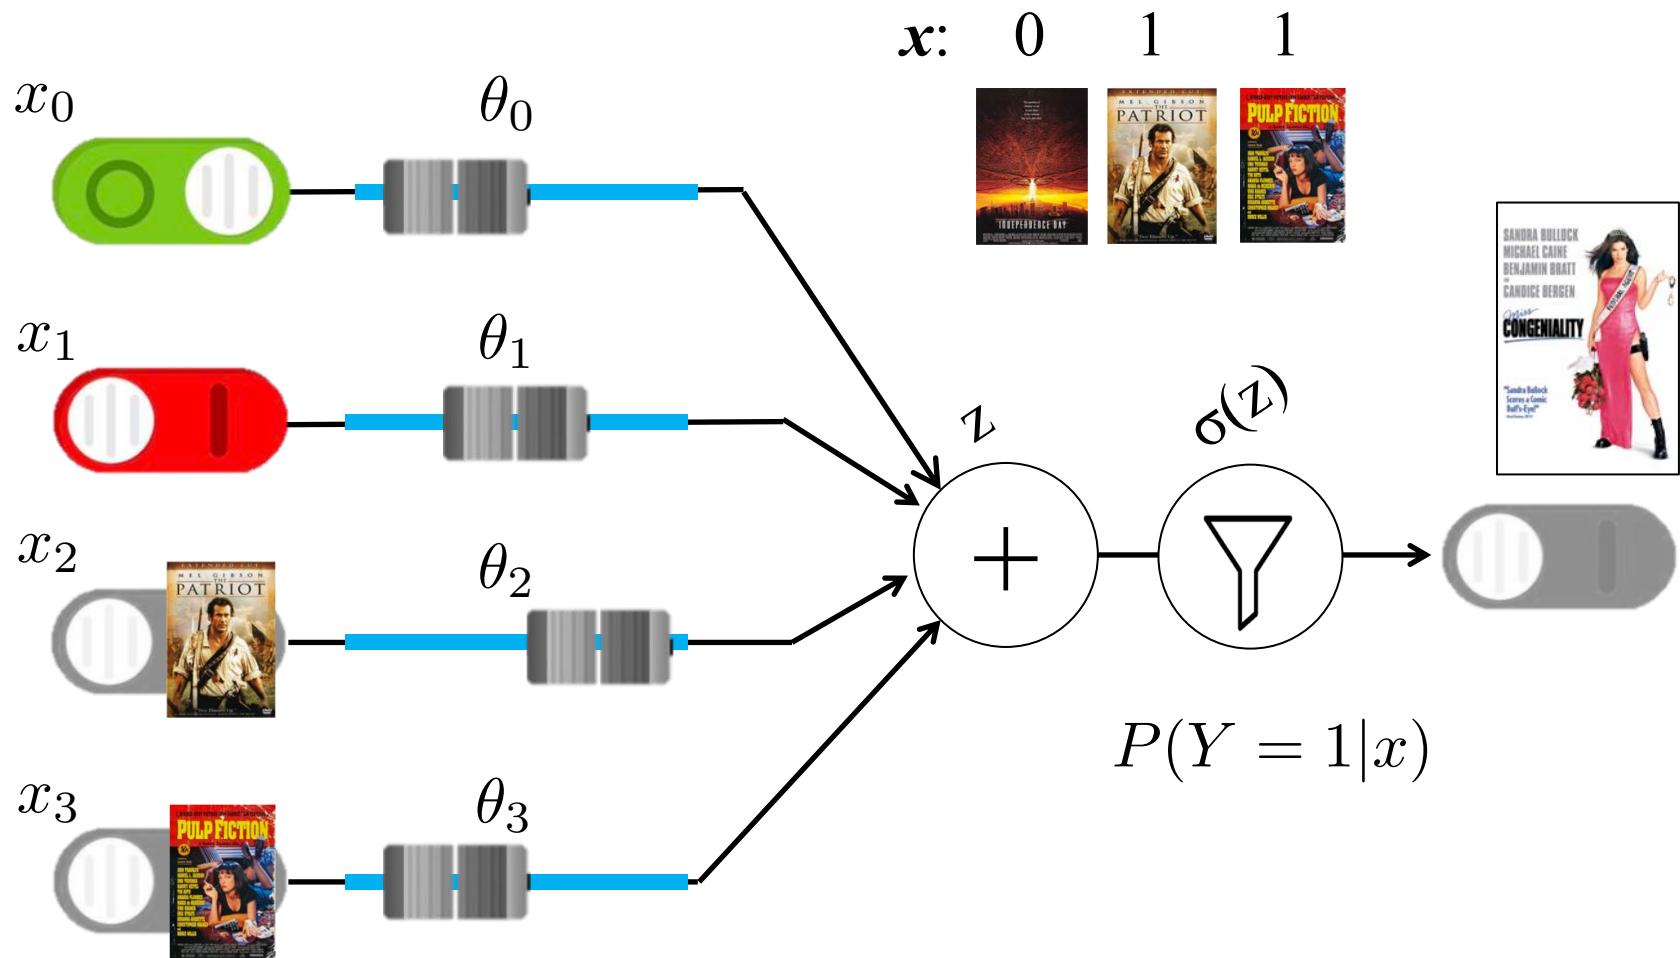

$$P(Y = 1|X = \mathbf{x}) = \sigma(\boldsymbol{\theta}^T \mathbf{x})$$

Logistic Regression

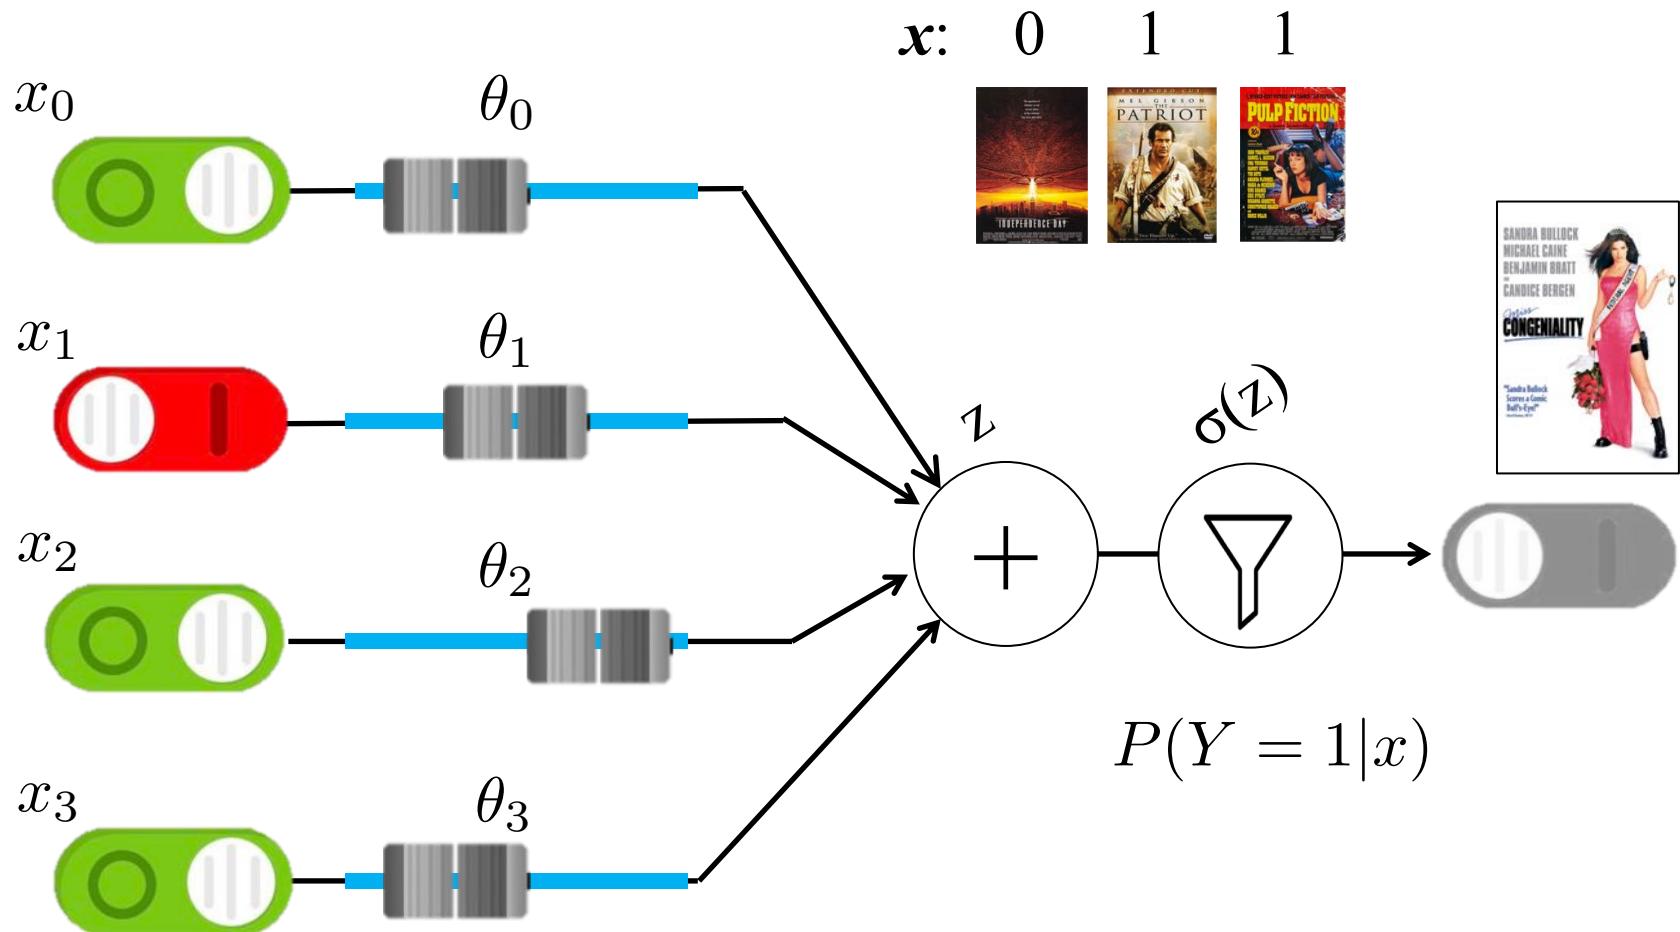

$$P(Y = 1|X = \mathbf{x}) = \sigma(\boldsymbol{\theta}^T \mathbf{x})$$

Logistic Regression

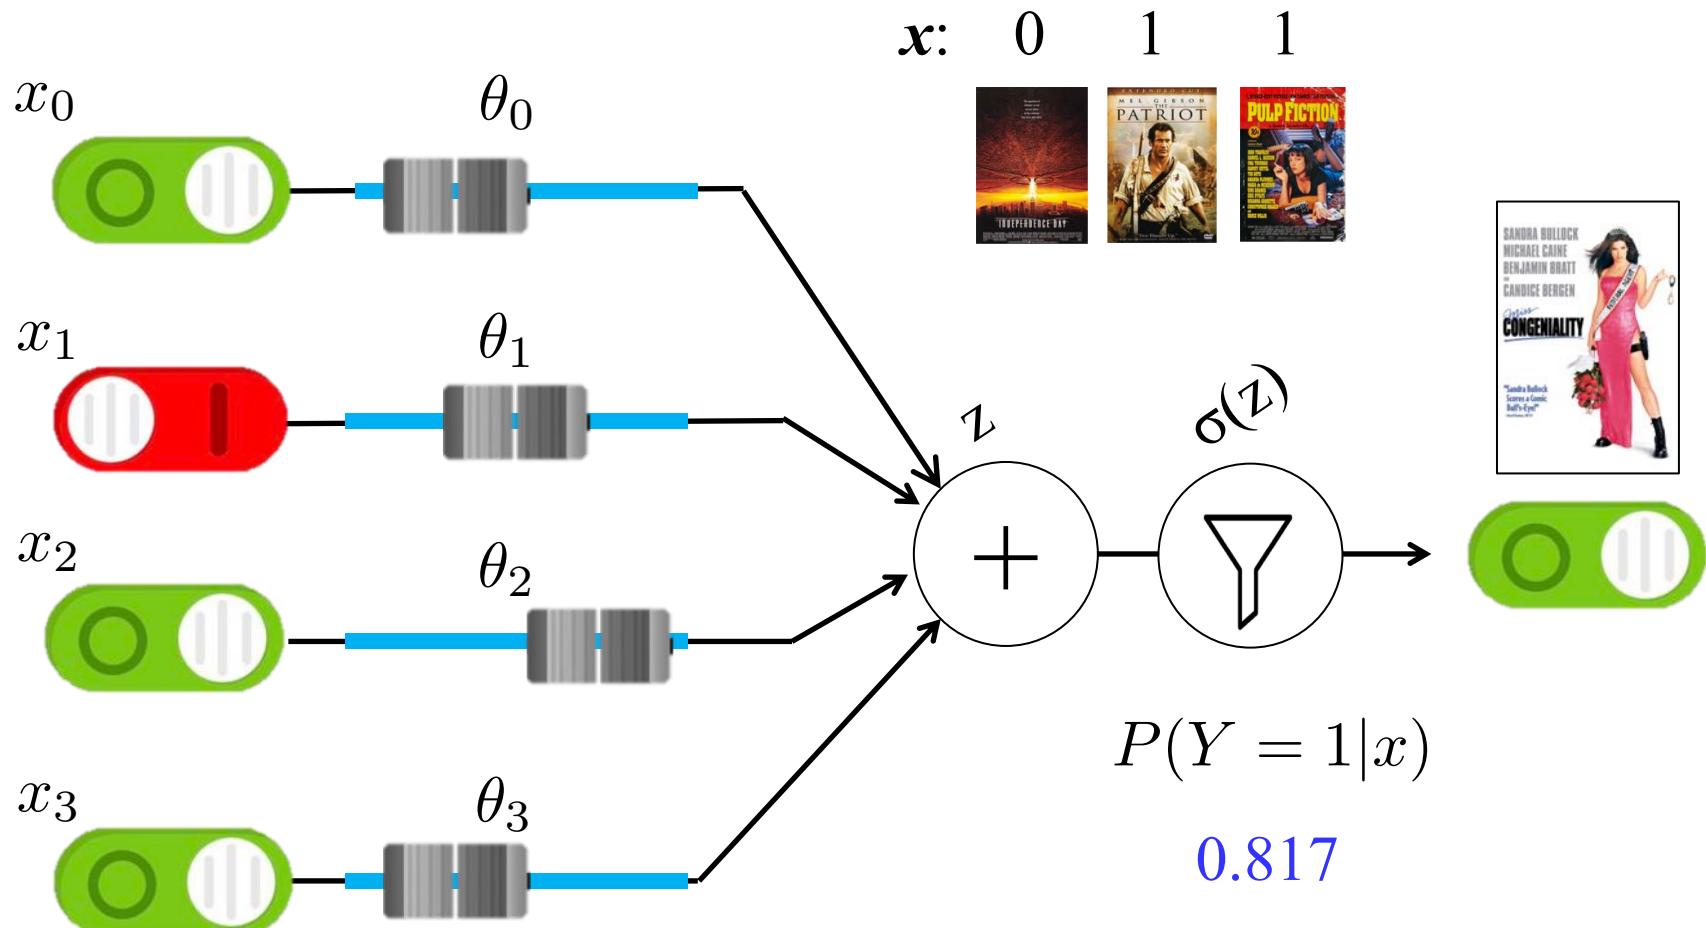

$$P(Y = 1|X = \mathbf{x}) = \sigma(\theta^T \mathbf{x})$$

Logistic Regression

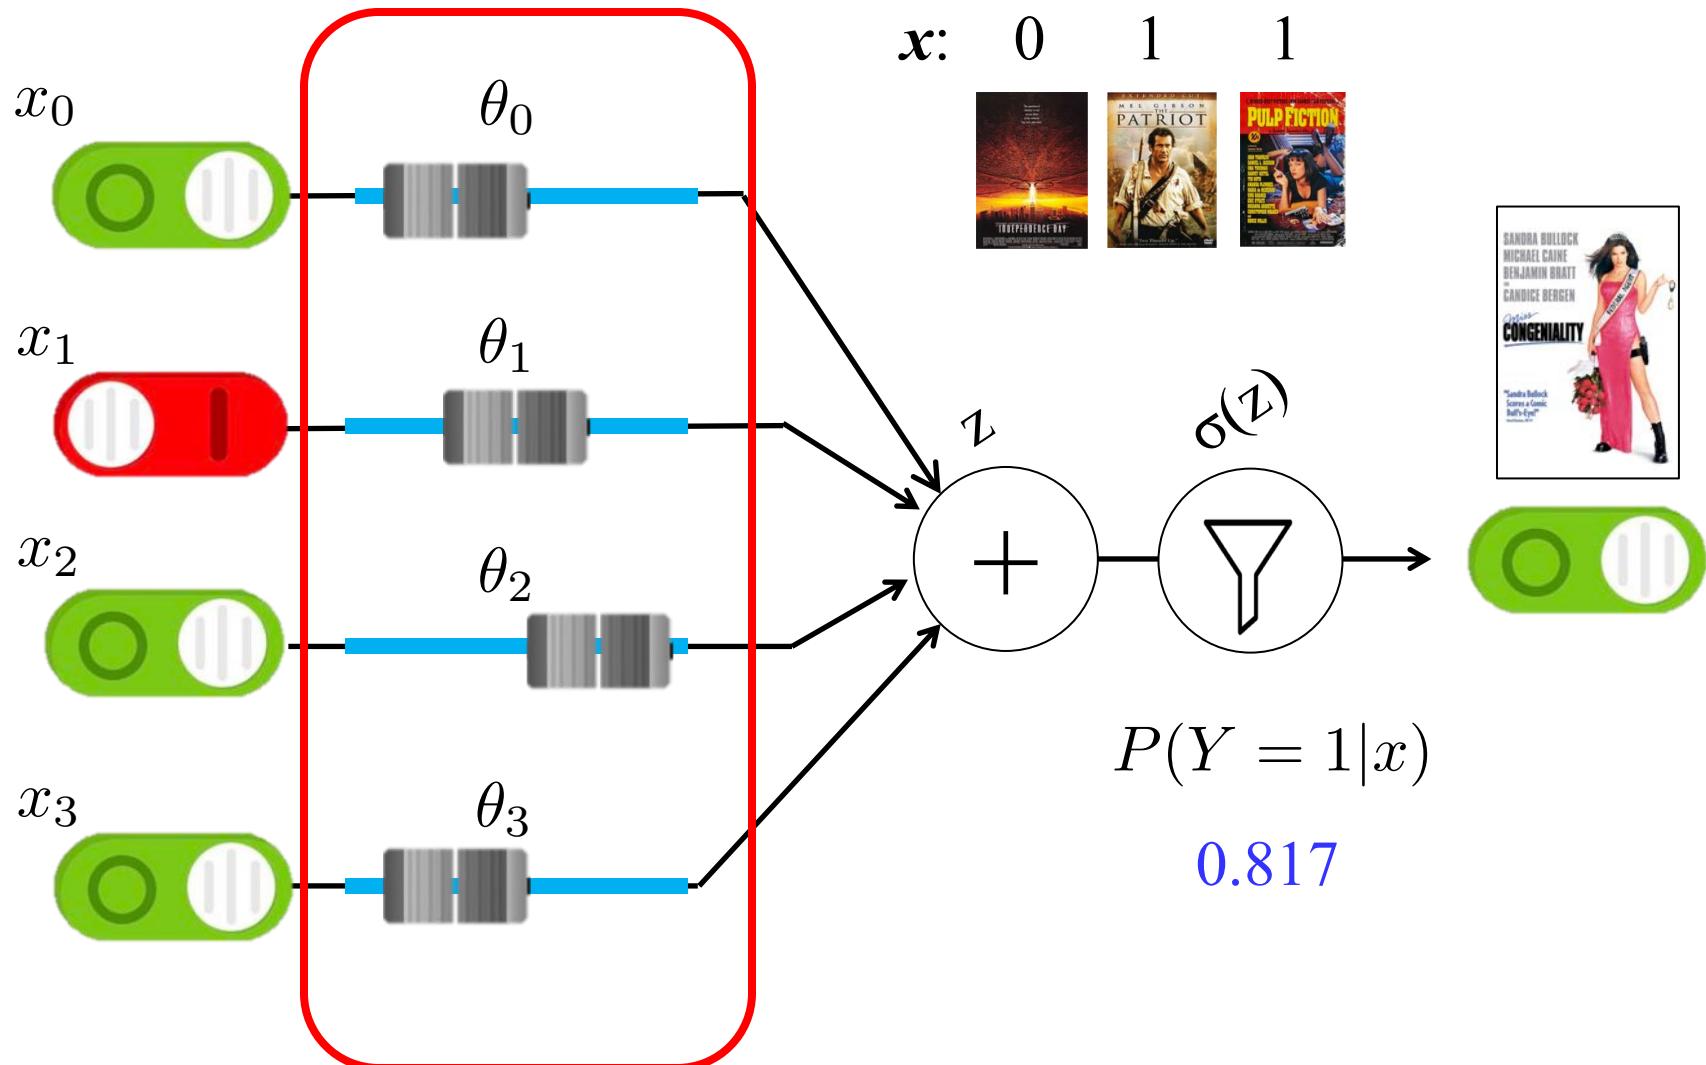

$$P(Y = 1|X = \mathbf{x}) = \sigma(\boldsymbol{\theta}^T \mathbf{x})$$

Logistic Regression

$$P(Y = 1|X = \mathbf{x}) = \sigma(\boldsymbol{\theta}^T \mathbf{x})$$

Logistic Regression

$$P(Y = 1|X = \mathbf{x}) = \sigma(\boldsymbol{\theta}^T \mathbf{x})$$

Math for Logistic Regression

1

Make logistic regression assumption

$$P(Y = 1|X = \mathbf{x}) = \sigma(\theta^T \mathbf{x})$$

$$P(Y = 0|X = \mathbf{x}) = 1 - \sigma(\theta^T \mathbf{x})$$

Often call this
 \hat{y}

2

Calculate the log likelihood for all data

$$LL(\theta) = \sum_{i=0}^n y^{(i)} \log \sigma(\theta^T \mathbf{x}^{(i)}) + (1 - y^{(i)}) \log[1 - \sigma(\theta^T \mathbf{x}^{(i)})]$$

3

Get derivative of log likelihood with respect to thetas

$$\frac{\partial LL(\theta)}{\partial \theta_j} = \sum_{i=0}^n \left[y^{(i)} - \sigma(\theta^T \mathbf{x}^{(i)}) \right] x_j^{(i)}$$

Logistic Regression Training

Initialize: $\theta_j = 0$ for all $0 \leq j \leq m$

Repeat many times:

gradient[j] = 0 for all $0 \leq j \leq m$

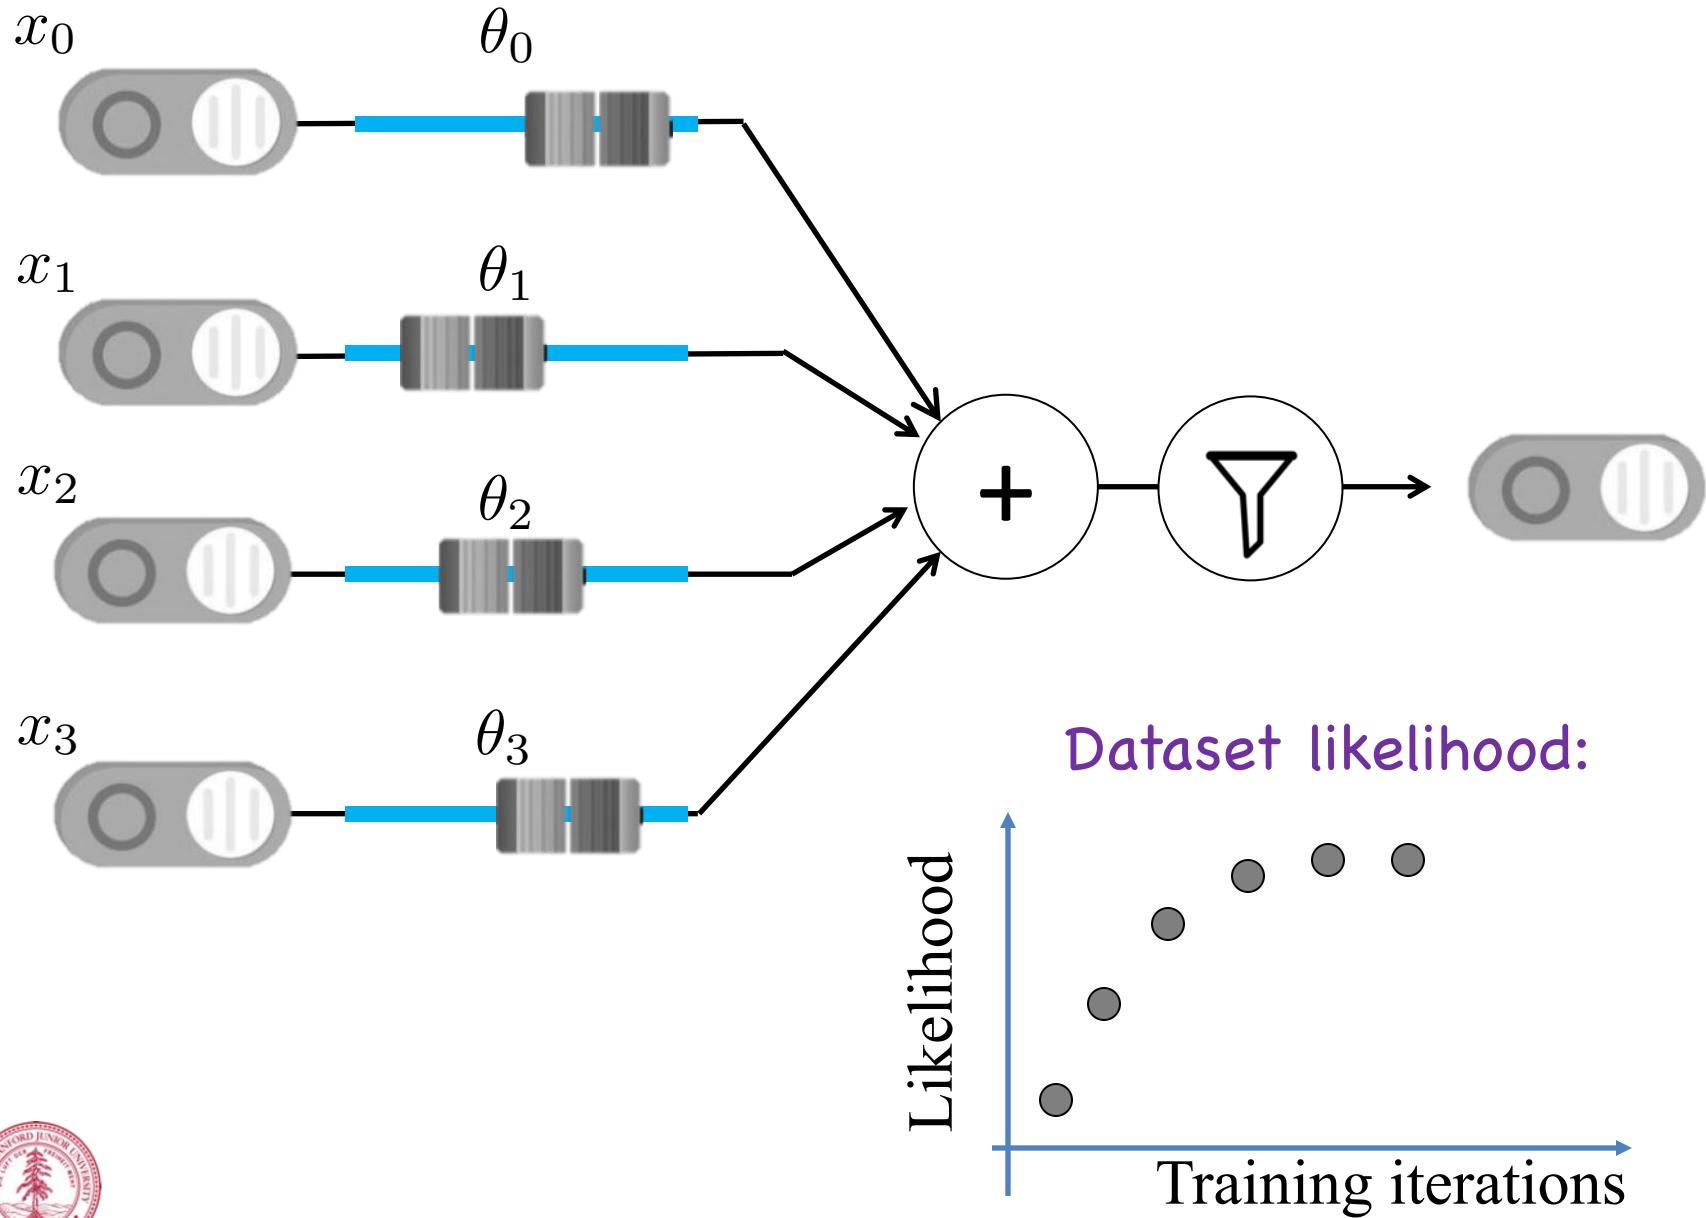

For each training example (x, y) :

For each parameter j :

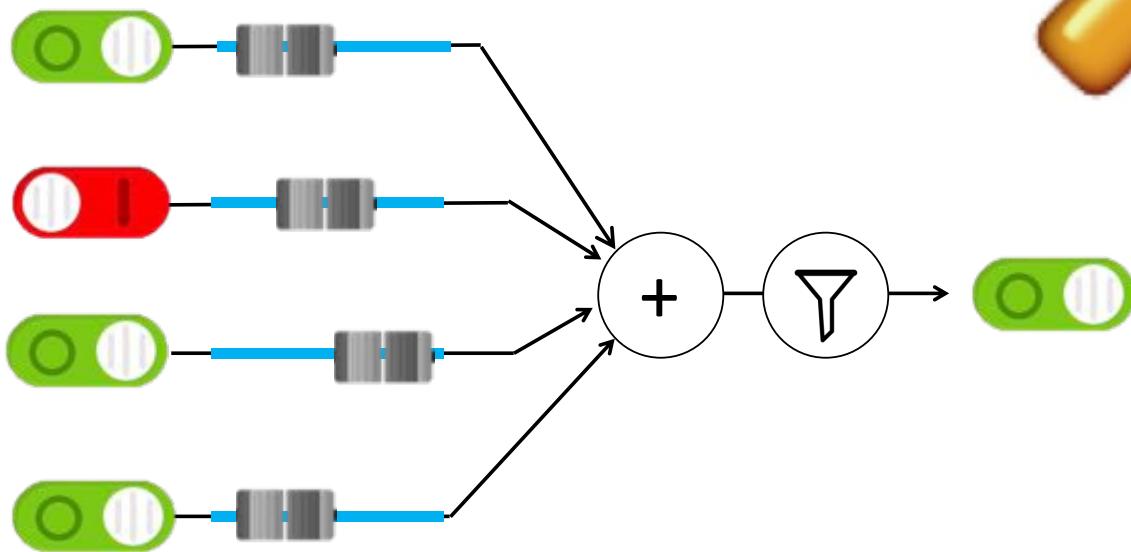

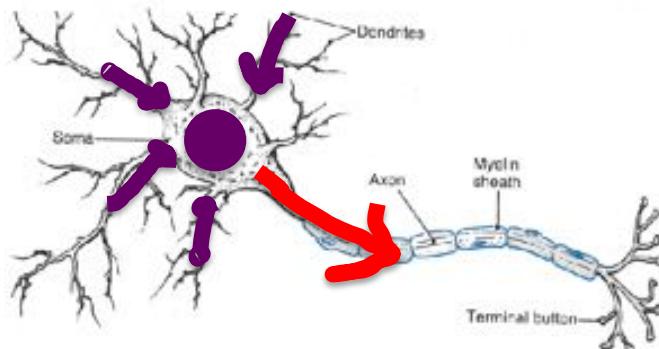

$$\text{gradient}[j] += x_j \left(y - \frac{1}{1 + e^{-\theta^T x}} \right)$$

$\theta_j += \eta * \text{gradient}[j]$ for all $0 \leq j \leq m$

Training

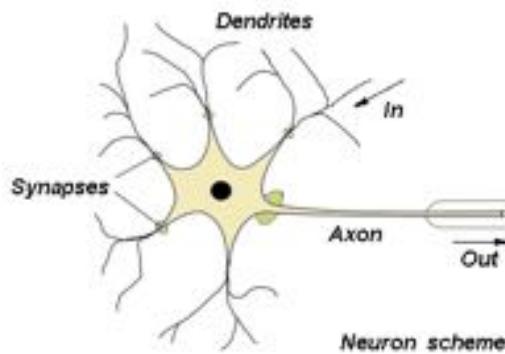

Artificial Neurons

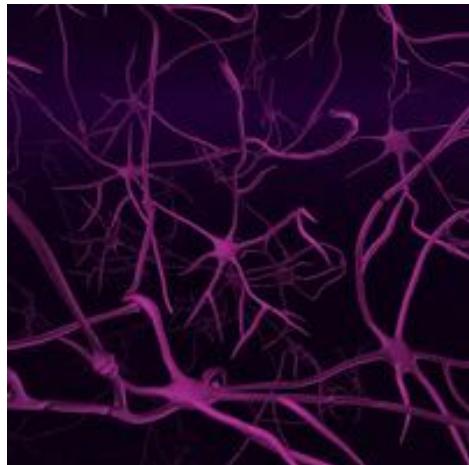

Biological Basis for Neural Networks

(aka Neural Networks)

Deep learning is (at its core) many logistic regression pieces stacked on top of each other.

Digit Recognition Example

Let's make feature vectors from pictures of numbers

$$\mathbf{x}^{(i)} = [0, 0, 0, 0, \dots, 1, 0, 0, 1, \dots, 0, 0, 1, 0]$$
$$y^{(i)} = 0$$

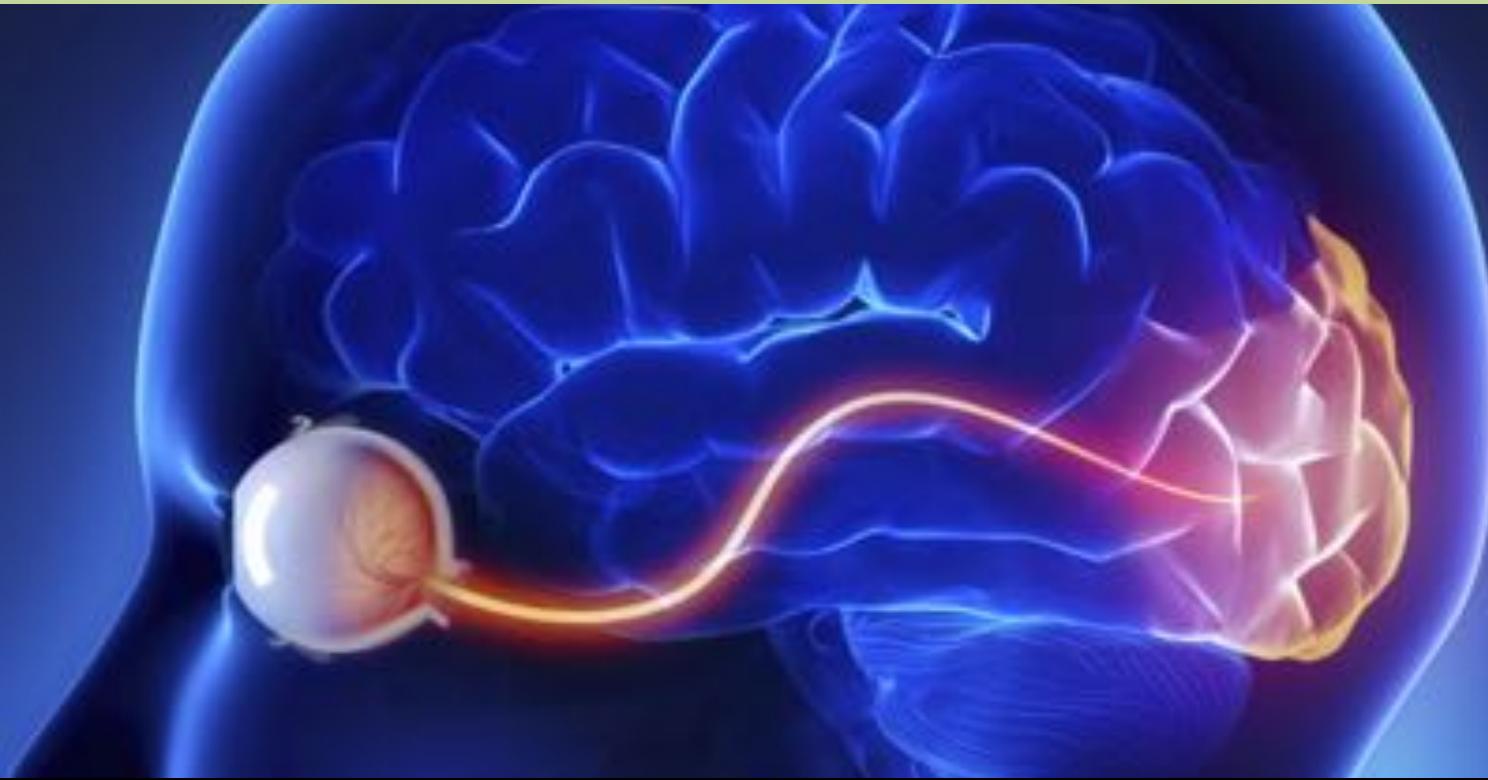

$$\mathbf{x}^{(i)} = [0, 0, 1, 1, \dots, 0, 1, 1, 0, \dots, 0, 1, 0, 0]$$
$$y^{(i)} = 1$$

Computer Vision

Vision in your Brain

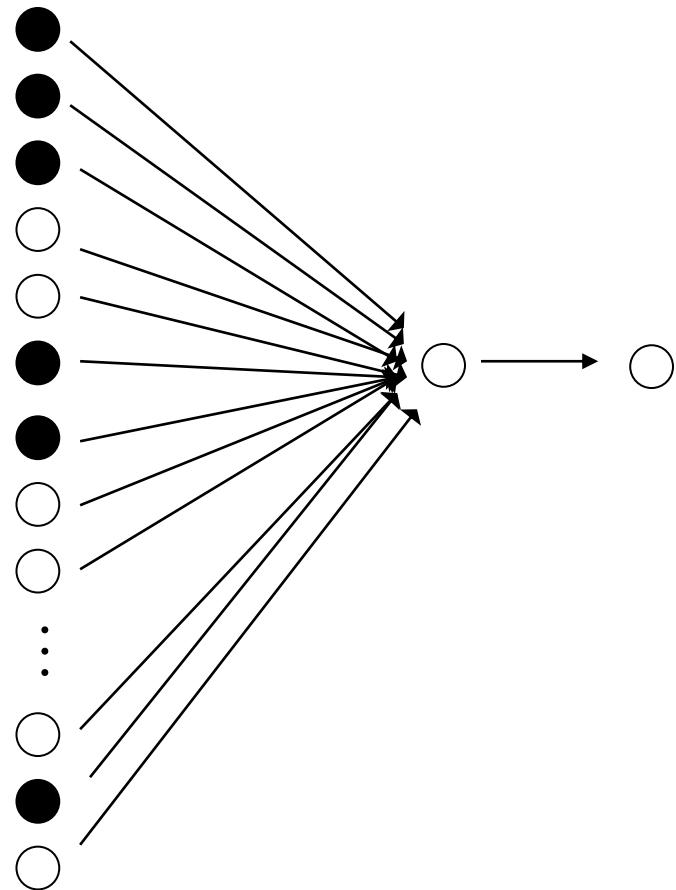

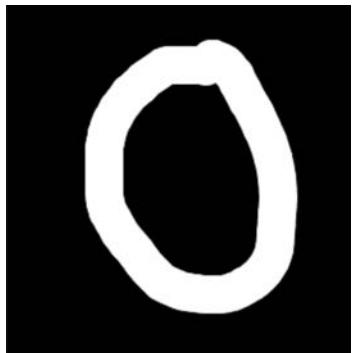

Hundreds of millions of neurons [1]

Visual neurons make up up 30% of your cortex [1]

Only Have to Do Three Things

- 1 Make deep learning assumption
- 2 Calculate the log probability for all data
- 3 Get partial derivative of log likelihood with respect to each theta

Sanity Check

3

Get partial derivative of log likelihood with respect to each theta

Why?

Why We Calculate Partial Derivatives

A deep learning model gets its **intelligence** by having **useful thetas**.

We can find **useful thetas**, by searching for ones that **maximize likelihood** of our training data

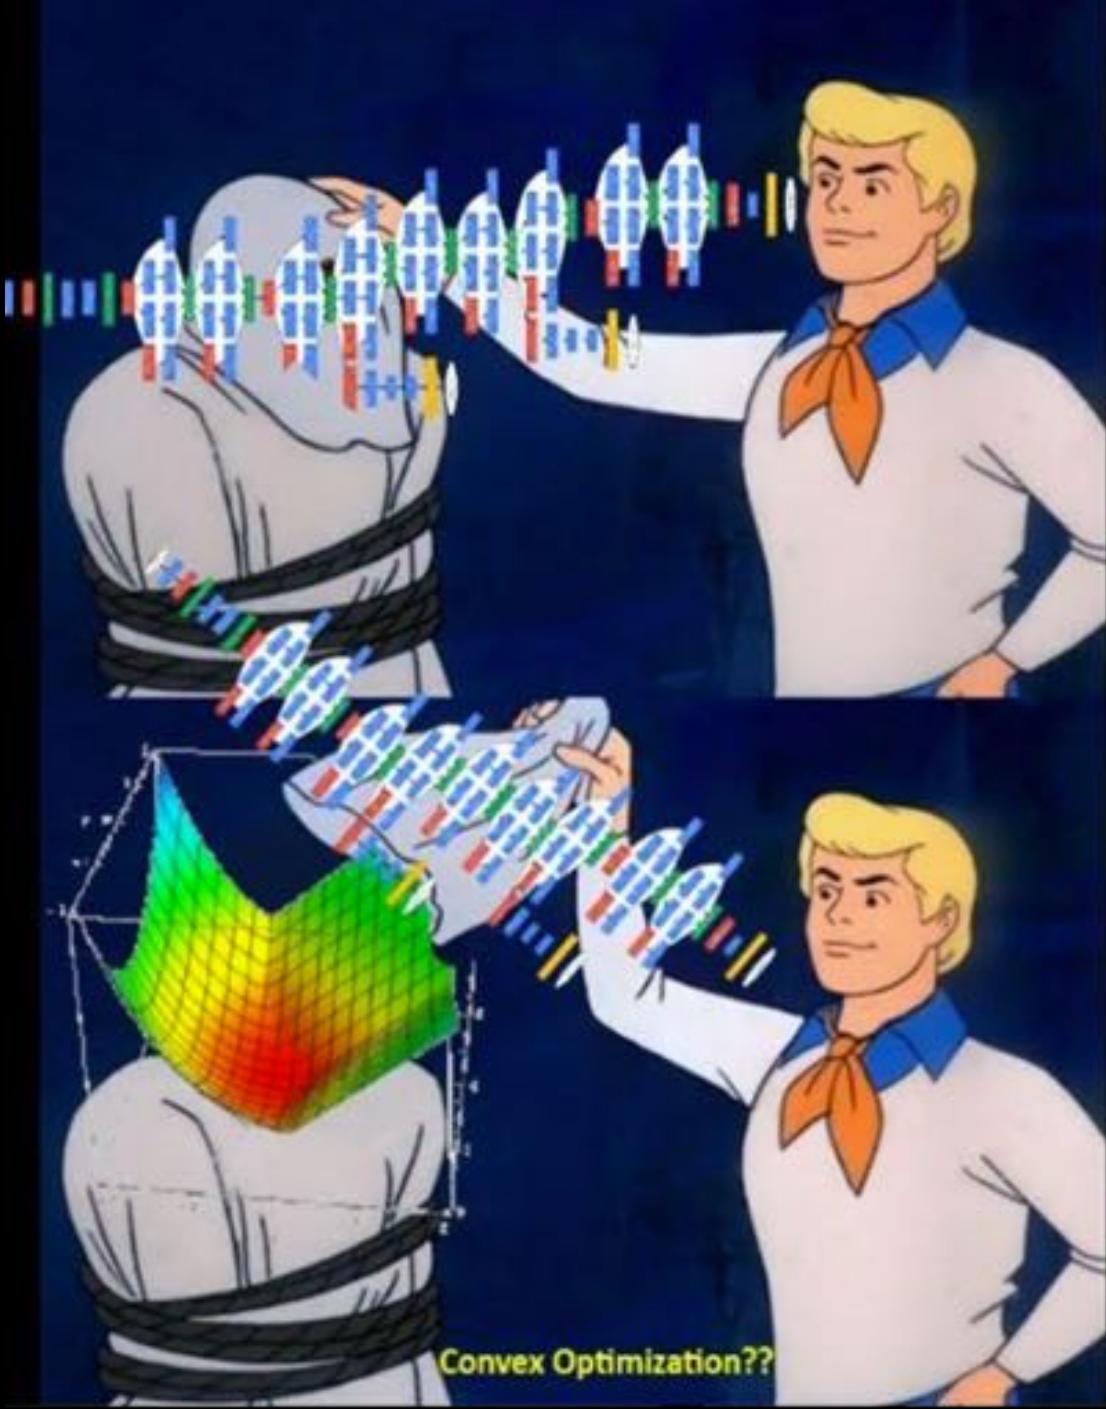

We can **maximize likelihood** using **optimization techniques** (such as gradient ascent).

In order to use **optimization techniques**, we need to calculate the **partial derivative** of likelihood with respect to thetas.

Basically MLE is hard because it has so many details

Thanks to Keith Eicher

Convex Optimization??

Only Have to Do Three Things

1

Make deep learning assumption

$$P(Y = 1|X = \mathbf{x}) = \hat{y}$$

$$P(Y = 0|X = \mathbf{x}) = 1 - \hat{y}$$

2

Calculate the log probability for all data

Same Assumption, Same LL

$$P(Y = 1 | X = \mathbf{x}) = \hat{y} \quad \hat{y} = \sigma \left(\sum_{j=0}^{m_h} \mathbf{h}_j \theta_j^{(\hat{y})} \right) \quad \mathbf{h}_j = \sigma \left(\sum_{i=0}^{m_x} \mathbf{x}_i \theta_{i,j}^{(h)} \right)$$

For one datum

$$P(Y = y | \mathbf{X} = \mathbf{x}) = (\hat{y})^y (1 - \hat{y})^{1-y}$$

Feel the Bern!
 $Y \sim \text{Bern}(\hat{y})$

For IID data

$$\begin{aligned} L(\theta) &= \prod_{i=1}^n P(Y = y^{(i)} | X = \mathbf{x}^{(i)}) \\ &= \prod_{i=1}^n (\hat{y}^{(i)})^{y^{(i)}} \cdot [1 - (\hat{y}^{(i)})]^{(1-y^{(i)})} \end{aligned}$$

Take the log

$$LL(\theta) = \sum_{i=1}^n y^{(i)} \log \hat{y}^{(i)} + (1 - y^{(i)}) \log [1 - \hat{y}^{(i)}]$$

Only Have to Do Three Things

1

Make deep learning assumption

$$P(Y = 1|X = \mathbf{x}) = \hat{y}$$

$$P(Y = 0|X = \mathbf{x}) = 1 - \hat{y}$$

2

Calculate the log probability for all data

$$LL(\theta) = \sum_{i=0}^n y^{(i)} \log \hat{y}^{(i)} + (1 - y^{(i)}) \log[1 - \hat{y}^{(i)}]$$

3

Get partial derivative of log likelihood with respect to each theta

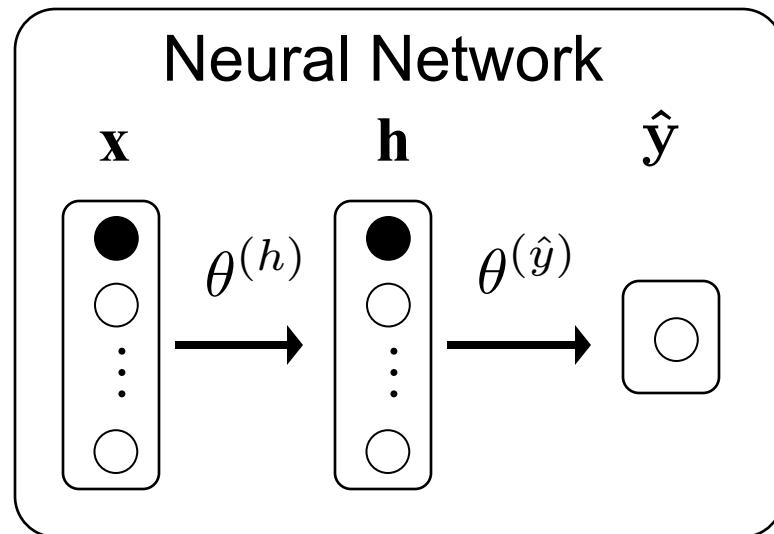

Derivative Goals

Loss with respect to
output layer params

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}}$$

Loss with respect to
hidden layer params

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}}$$

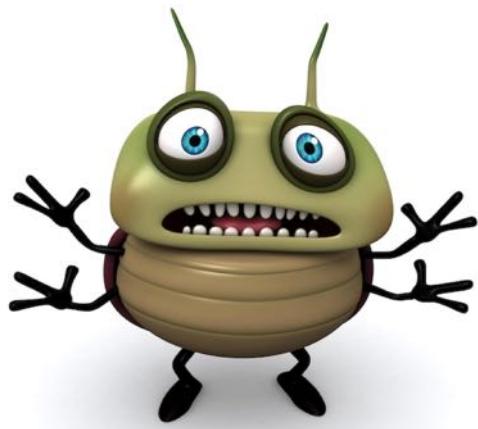

Bad Approach

$$LL(\theta) = y \log \hat{y} + (1 - y) \log[1 - \hat{y}]$$

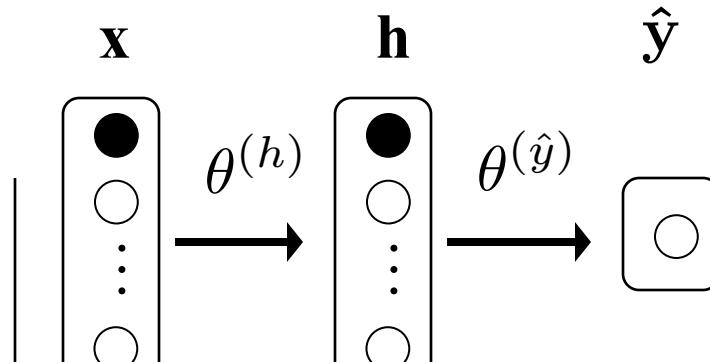

$$\hat{y} = \sigma \left(\sum_{i=0}^{m_h} \mathbf{h}_i \theta_i^{(\hat{y})} \right)$$

Math bug

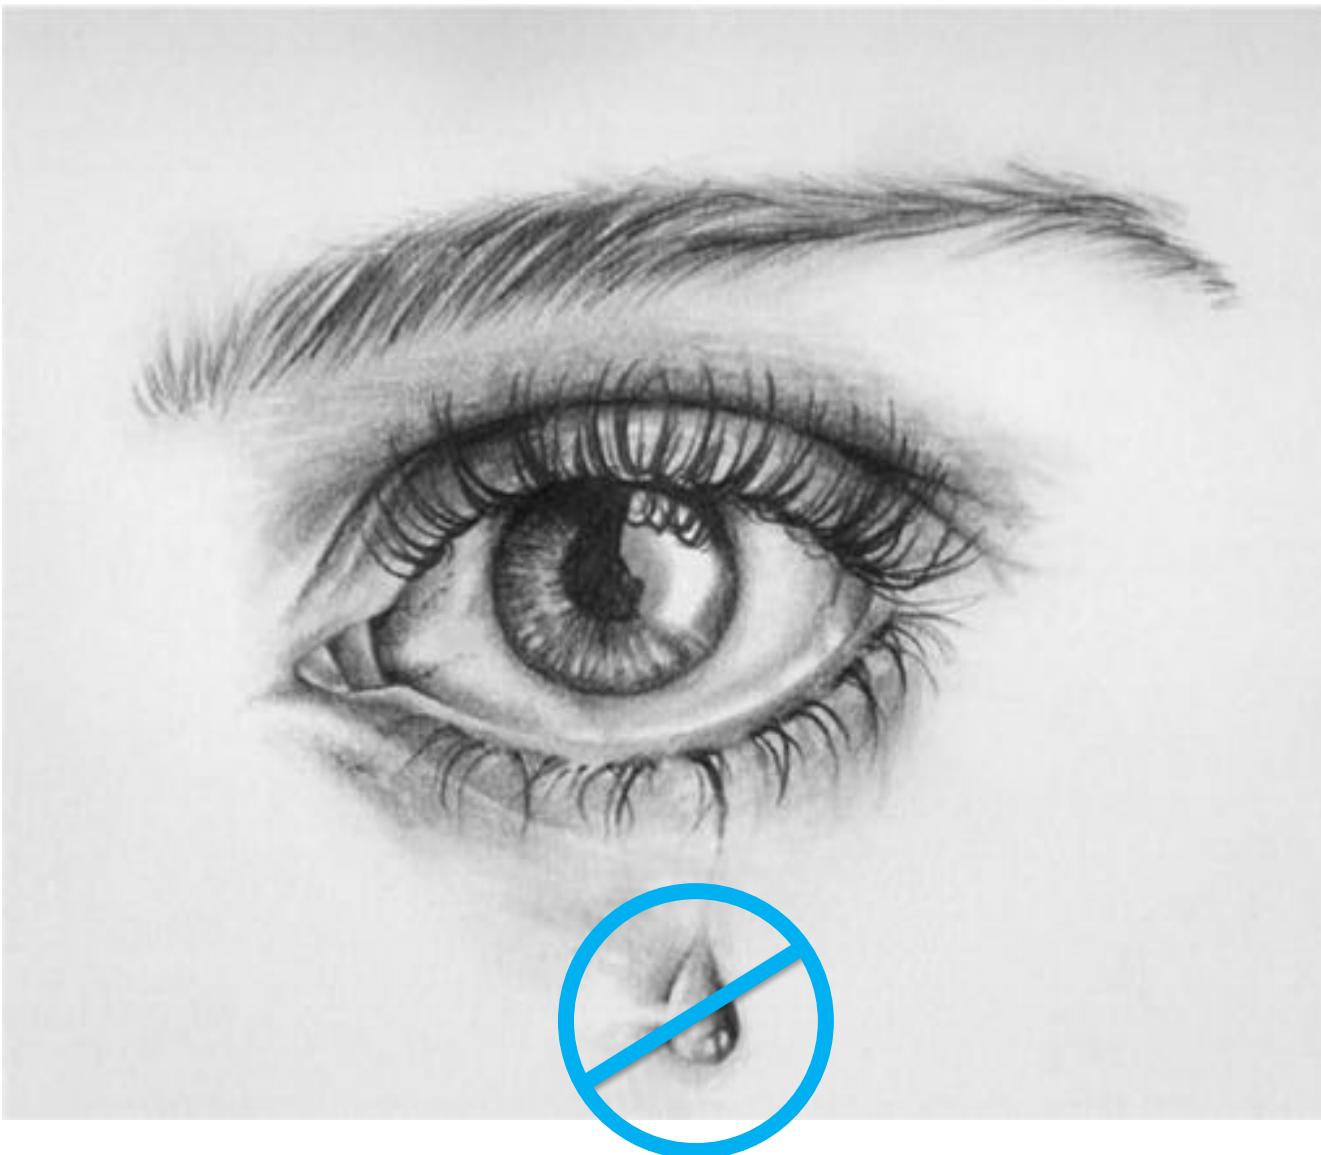

$$= \sigma \left(\sum_{i=0}^{m_h} \left[\sigma \left(\sum_{j=0}^{m_x} \mathbf{x}_j \theta_{i,j}^{(\mathbf{h})} \right) \right] \theta_i^{(\hat{y})} \right)$$

Neural Network

Derivatives Without Tears

Big Idea #1: Chain Rule

Woah Mr Blanton, you were right.
Chain rule is useful!

$$\frac{\partial f(z)}{\partial x} = \frac{\partial f(z)}{\partial z} \cdot \frac{\partial z}{\partial x}$$

First use:

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}} = \frac{\partial LL}{\partial \hat{y}} \cdot \frac{\partial \hat{y}}{\partial \theta_i^{(\hat{y})}}$$

Big Idea #2: Sigmoid Derivative

True fact about sigmoid functions

$$\frac{\partial}{\partial z} \sigma(z) = \sigma(z)[1 - \sigma(z)]$$

Errata: (fixed) typo on similar slide from last class

Big Idea #3: Derivative of Sum

$$LL(\theta) = \sum_{i=0}^n y^{(i)} \log \hat{y}^{(i)} + (1 - y^{(i)}) \log[1 - \hat{y}^{(i)}]$$

We only need to calculate the gradient for one training example!

$$\frac{\partial}{\partial x} \sum f(x) = \sum \frac{\partial}{\partial x} f(x)$$

We will pretend we only have one example

$$LL(\theta) = y \log \hat{y} + (1 - y) \log[1 - \hat{y}]$$

We can sum up the gradients of each example to get the correct answer

Warmup

Warmup

Compute:

$$\frac{\partial}{\partial \theta_j} \sigma(z)$$

Assume you can easily calculate:

$$\frac{\partial}{\partial \theta_j} z$$

Future Chris: Write this on the board ☺ - Thanks, Past Chris

This is Sparta!!!!

Derivative Goals

Loss with respect to
output layer params

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}}$$

Loss with respect to
hidden layer params

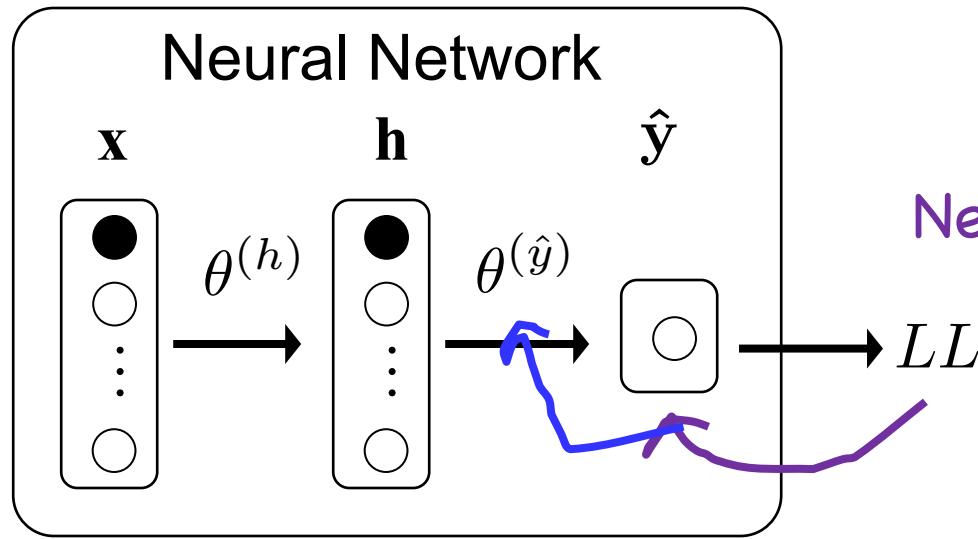

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}}$$

Chain Rule Example 1

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}}$$

Goal

Network

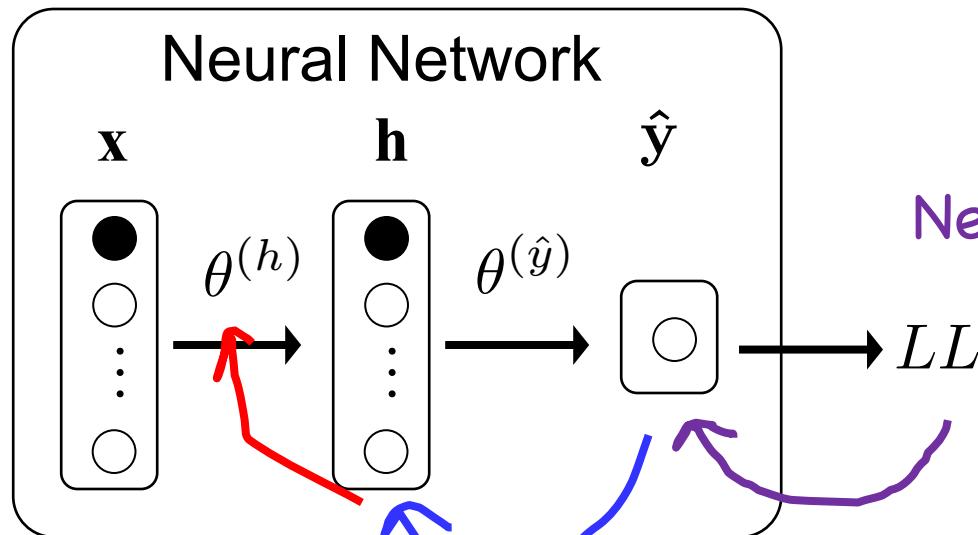

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}} = \boxed{\frac{\partial LL}{\partial \hat{y}}} \cdot \boxed{\frac{\partial \hat{y}}{\partial \theta_i^{(\hat{y})}}}$$

Decomposition

Chain Rule Example 2

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}}$$

Goal

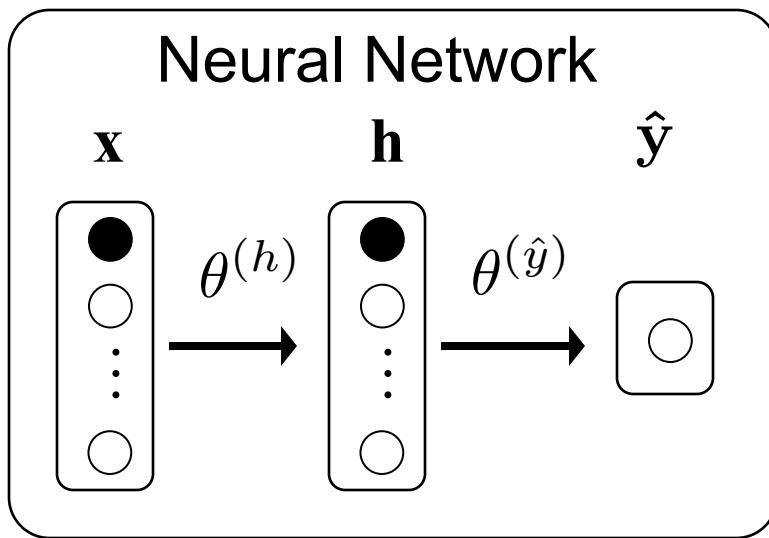

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}} = \frac{\partial LL}{\partial \hat{y}} \cdot \frac{\partial \hat{y}}{\partial h_j} \cdot \frac{\partial h_j}{\partial \theta_{i,j}^{(h)}}$$

Decomposition

Decomposition

Gradient of output layer params

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}} = \frac{\partial LL}{\partial \hat{y}} \cdot \frac{\partial \hat{y}}{\partial \theta_i^{(\hat{y})}}$$

Gradient of output layer params

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}} = \boxed{\frac{\partial LL}{\partial \hat{y}}} \cdot \frac{\partial \hat{y}}{\partial \theta_i^{(\hat{y})}}$$

$$LL(\theta) = y \log \hat{y} + (1 - y) \log[1 - \hat{y}]$$

$$\frac{\partial LL(\theta)}{\partial \hat{y}} = \frac{y}{\hat{y}} + \frac{(1 - y)}{(1 - \hat{y})} \cdot \frac{\partial(1 - \hat{y})}{\partial \hat{y}}$$

$$\frac{\partial LL(\theta)}{\partial \hat{y}} = \frac{y}{\hat{y}} - \frac{(1 - y)}{(1 - \hat{y})}$$

Gradient of output layer params

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}} = \boxed{\frac{\partial LL}{\partial \hat{y}}} \cdot \boxed{\frac{\partial \hat{y}}{\partial \theta_i^{(\hat{y})}}}$$

$$\hat{y} = \sigma \left(\sum_{j=0}^{m_h} \mathbf{h}_j \theta_j^{(\hat{y})} \right) = \sigma(z) \quad \text{where} \quad z = \sum_{j=0}^{m_h} \mathbf{h}_j \theta_j^{(\hat{y})}$$

$$\frac{\partial \hat{y}}{\partial \theta_i^{(\hat{y})}} = \hat{y}[1 - \hat{y}] \cdot \frac{\partial}{\partial \theta_i^{(\hat{y})}} \sum_{j=0}^{m_h} \mathbf{h}_j \theta_j^{(\hat{y})}$$

$$= \hat{y}[1 - \hat{y}] \cdot h_i$$

What! That's not scary!

Make it Simple

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}} =$$

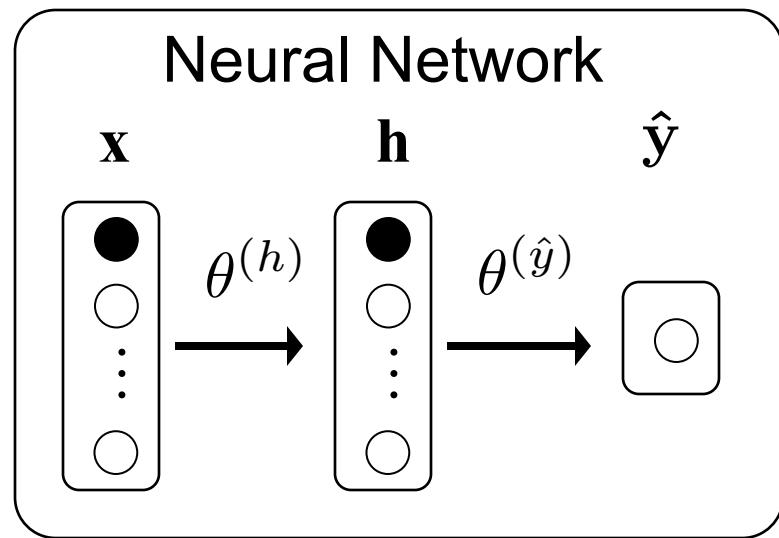

$$= \frac{y}{\hat{y}} - \frac{(1-y)}{(1-\hat{y})}$$

$$= \hat{y}[1 - \hat{y}] \cdot h_i$$

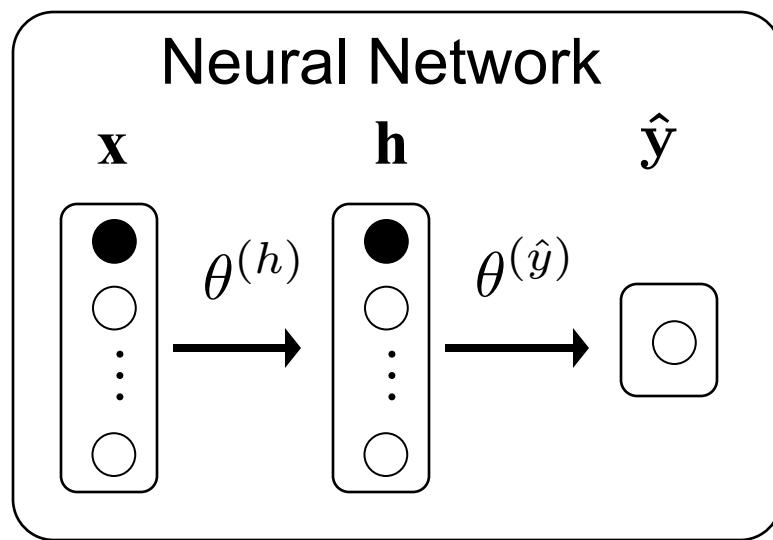

Boom!

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}}$$

Gradient of hidden layer params

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}} = \frac{\partial LL}{\partial \hat{y}} \cdot \frac{\partial \hat{y}}{\partial \mathbf{h}_j} \cdot \frac{\partial \mathbf{h}_j}{\partial \theta_{i,j}^{(h)}}$$

Gradient of hidden layer params

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}} = \boxed{\frac{\partial LL}{\partial \hat{y}}} \cdot \boxed{\frac{\partial \hat{y}}{\partial \mathbf{h}_j}} \cdot \frac{\partial \mathbf{h}_j}{\partial \theta_{i,j}^{(h)}}$$

$$\hat{y} = \sigma \left(\sum_{i=0}^{m_h} \mathbf{h}_i \theta_i^{(\hat{y})} \right)$$

$$\frac{\partial \hat{y}}{\partial \mathbf{h}_j} = \hat{y}[1 - \hat{y}] \theta_j^{(\hat{y})}$$

Wait is it over?

Gradient of hidden layer params

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}} = \boxed{\frac{\partial LL}{\partial \hat{y}}} \cdot \boxed{\frac{\partial \hat{y}}{\partial \mathbf{h}_j}} \cdot \boxed{\frac{\partial \mathbf{h}_j}{\partial \theta_{i,j}^{(h)}}}$$

$$\mathbf{h}_j = \sigma \left(\sum_{k=0}^{m_x} \mathbf{x}_k \theta_{k,j} \right)$$

$$\frac{\partial \mathbf{h}_j}{\partial \theta_{i,j}^{(h)}} = \mathbf{h}_j [1 - \mathbf{h}_j] \mathbf{x}_j$$

That one too?

Make it Simple

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}} =$$

$$= \frac{y}{\hat{y}} - \frac{(1-y)}{(1-\hat{y})}$$

$$= \hat{y}[1 - \hat{y}] \theta_j^{(\hat{y})}$$

$$= \mathbf{h}_j [1 - \mathbf{h}_j] \mathbf{x}_j$$

Congrats. You now know
Backpropagation

Moment of silence

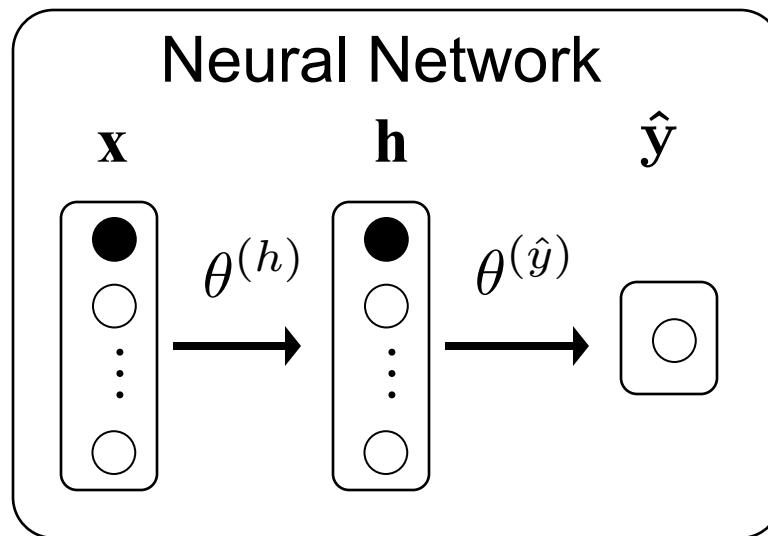

Summary: Simple Calculations For

Loss with respect to
output layer params

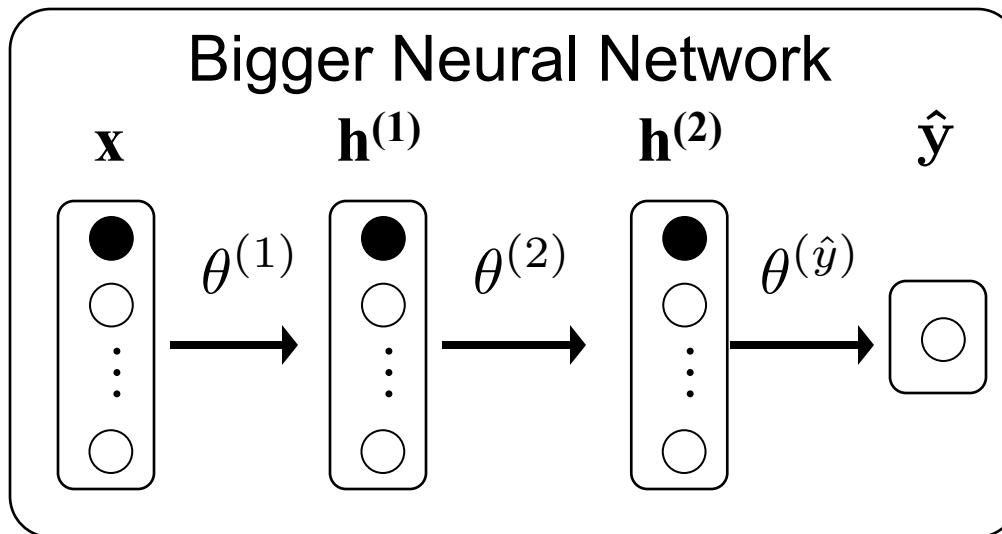

$$\frac{\partial LL(\theta)}{\partial \theta_i^{(\hat{y})}}$$

Loss with respect to
hidden layer params

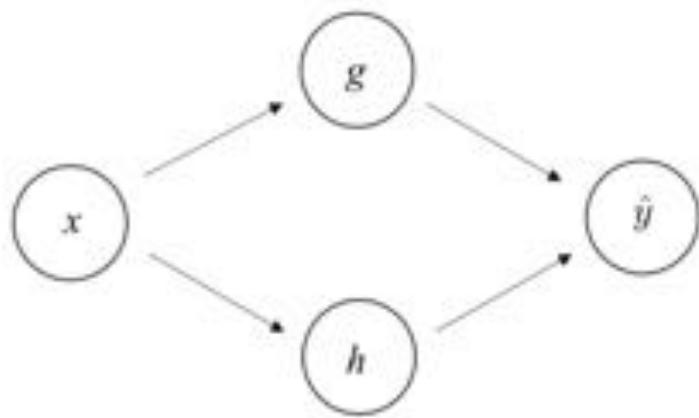

$$\frac{\partial LL(\theta)}{\partial \theta_{i,j}^{(h)}}$$

What Would You Do Here?

What If You Had a Neural Network Like This?

$$g = \text{sigmoid}(\theta_1 \cdot x)$$

$$h = \text{sigmoid}(\theta_2 \cdot x)$$

$$\hat{y} = \text{sigmoid}(\theta_3 \cdot g + \theta_4 \cdot h)$$

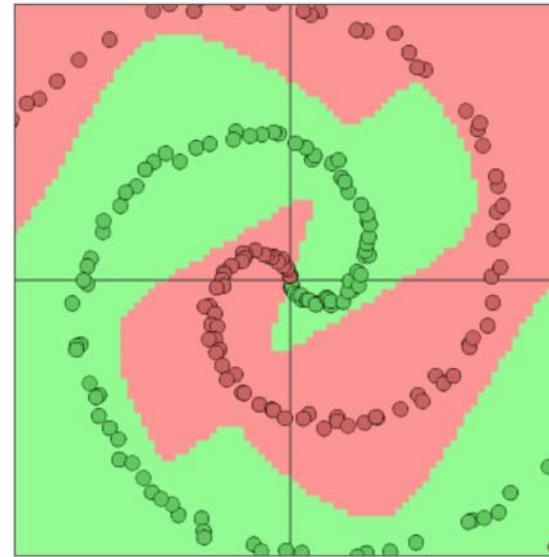

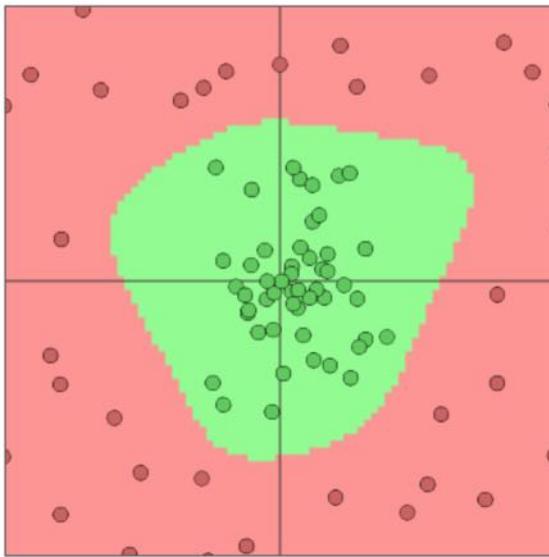

$$LL(\theta) = \sum_{i=1}^n y^{(i)} \log \hat{y}^{(i)} + (1 - y^{(i)}) \log(1 - \hat{y}^{(i)})$$

1. Calculate partial derivative for one data instance
2. Use chain rule!
3. Sigmoid derivatives come out simple if you use the right decomp.
4. You don't need to give the most reduced answer

Chain rule:
Game changer for
artificial intelligence

Neural Networks Can Learn Complex Functions

- Some data sets/functions are not separable

- These are classifiers learned by neural networks

<http://cs.stanford.edu/people/karpathy/convnetjs/demo/classify2d.html>

Some Extra Ideas!

Multiple Outputs

Multiple Output Classification?

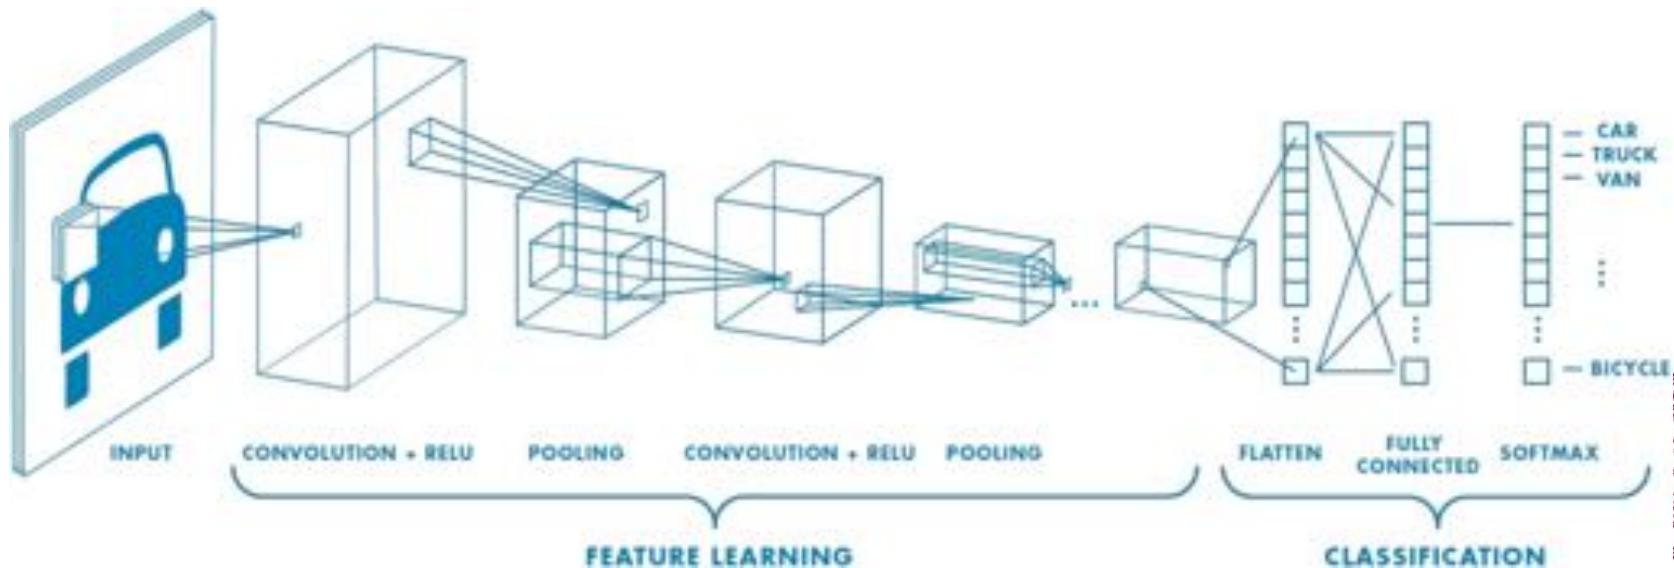

Softmax is a generalization of the sigmoid function that squashes a K-dimensional vector \mathbf{z} of arbitrary real values to a K-dimensional vector $\text{softmax}(\mathbf{z})$ of real values in the range [0, 1] that add up to 1.

$$P(Y = j | \mathbf{X} = \mathbf{x}) = \text{softmax}(f(\mathbf{x}))_j$$

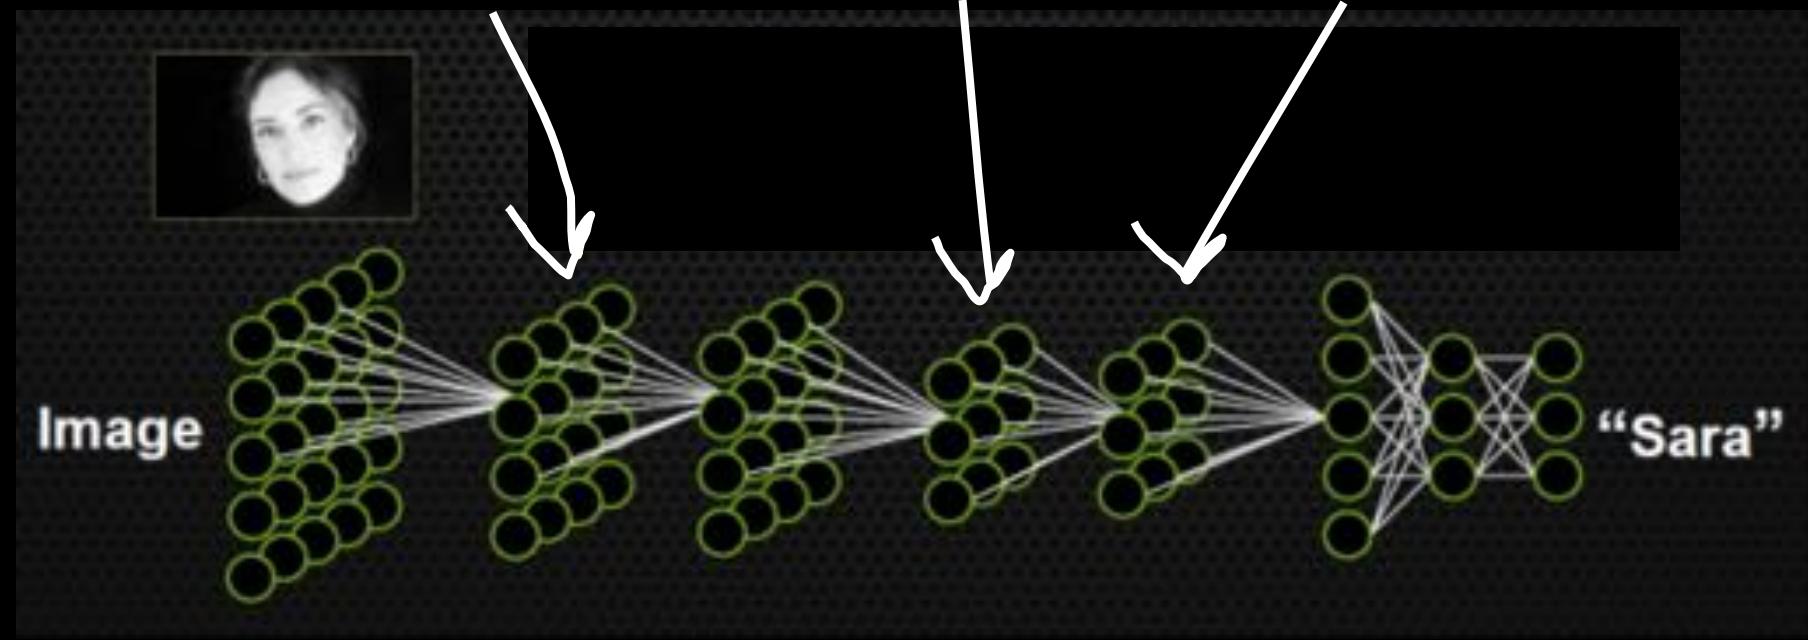

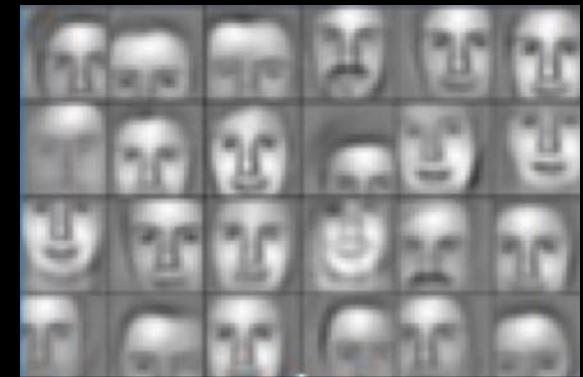

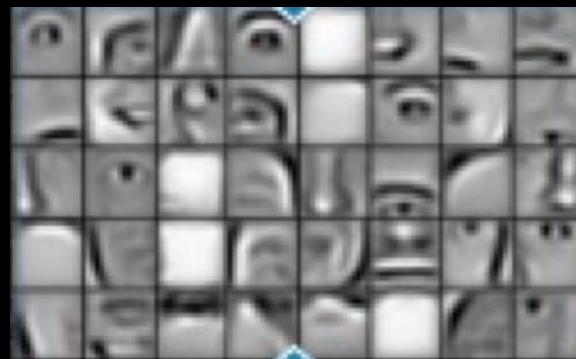

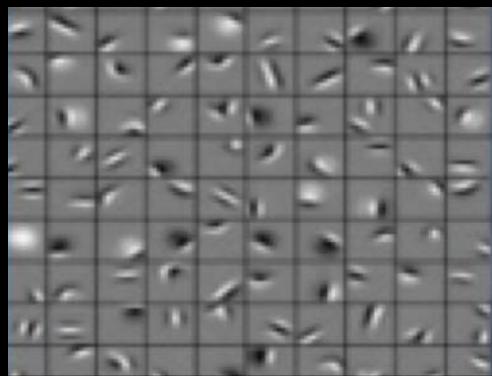

Shared Weights?

Convolution it turns out if you want to force some of your weights to be shared for different neurons, the math isn't that much harder. This is used a lot for vision (CNN).

Works for any number of layers

How many parameters
is too many?

Good ML = Generalization

- Goal of machine learning: build models that *generalize* well to predicting new data
 - “Overfitting”: fitting the training data too well, so we lose generality of model

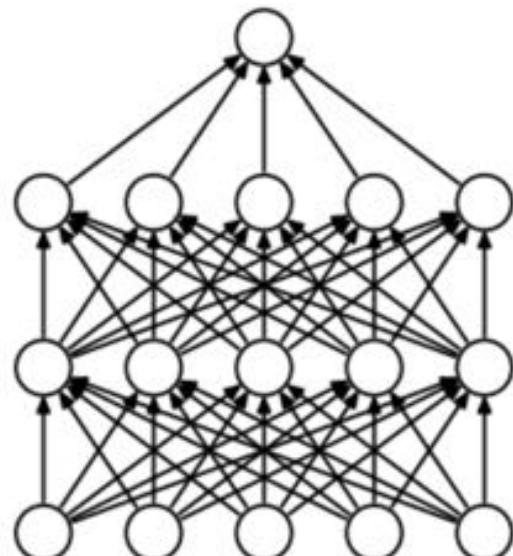

- Polynomial on the right fits training data perfectly!
- Which would you rather use to predict a new data point?

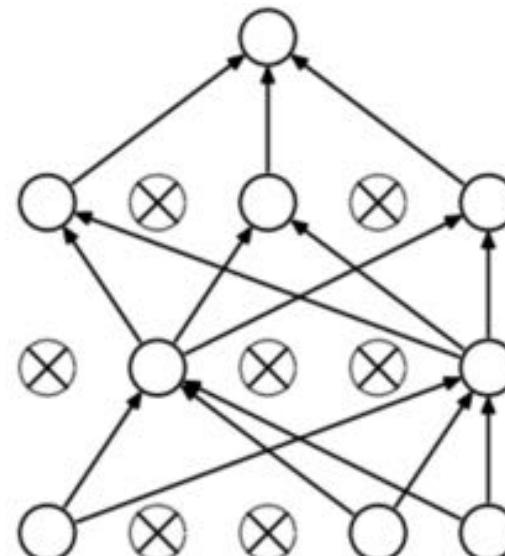

Prevent Overfitting?

Dropout when your model is training, randomly turn off your neurons with probability 0.5. It will make your network more robust.

(a) Standard Neural Net

(b) After applying dropout.

Not everything is classification

Making Decisions?

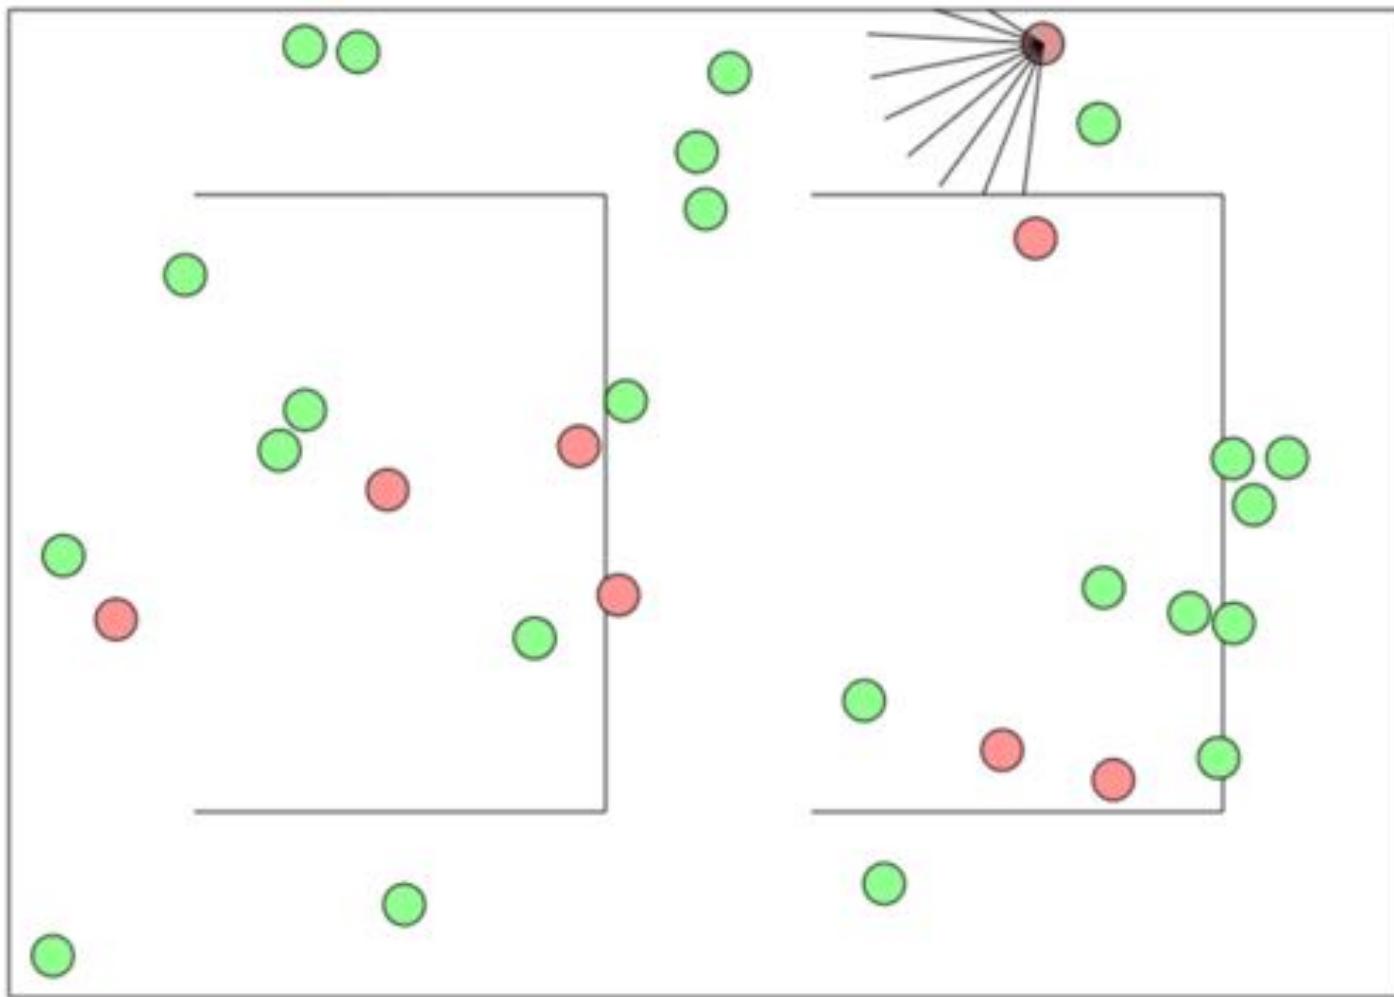

Deep Reinforcement Learning

Instead of having the output of a model be a probability you can make it an expectation.

Deep Reinforcement Learning

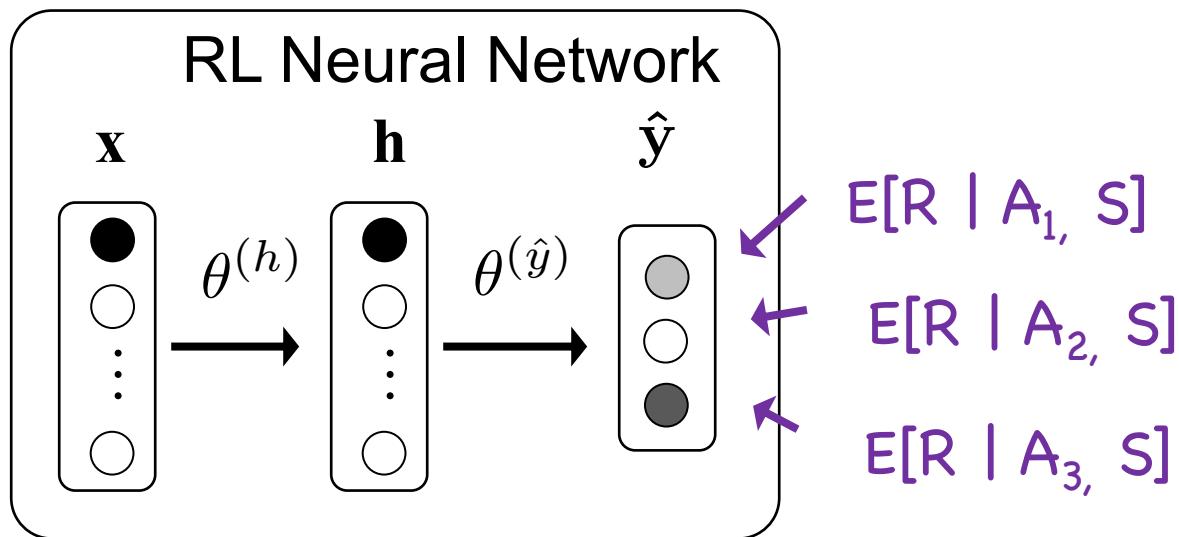

<http://cs.stanford.edu/people/karpathy/convnetjs/demo/rldemo.html>

Deep Reinforcement Learning

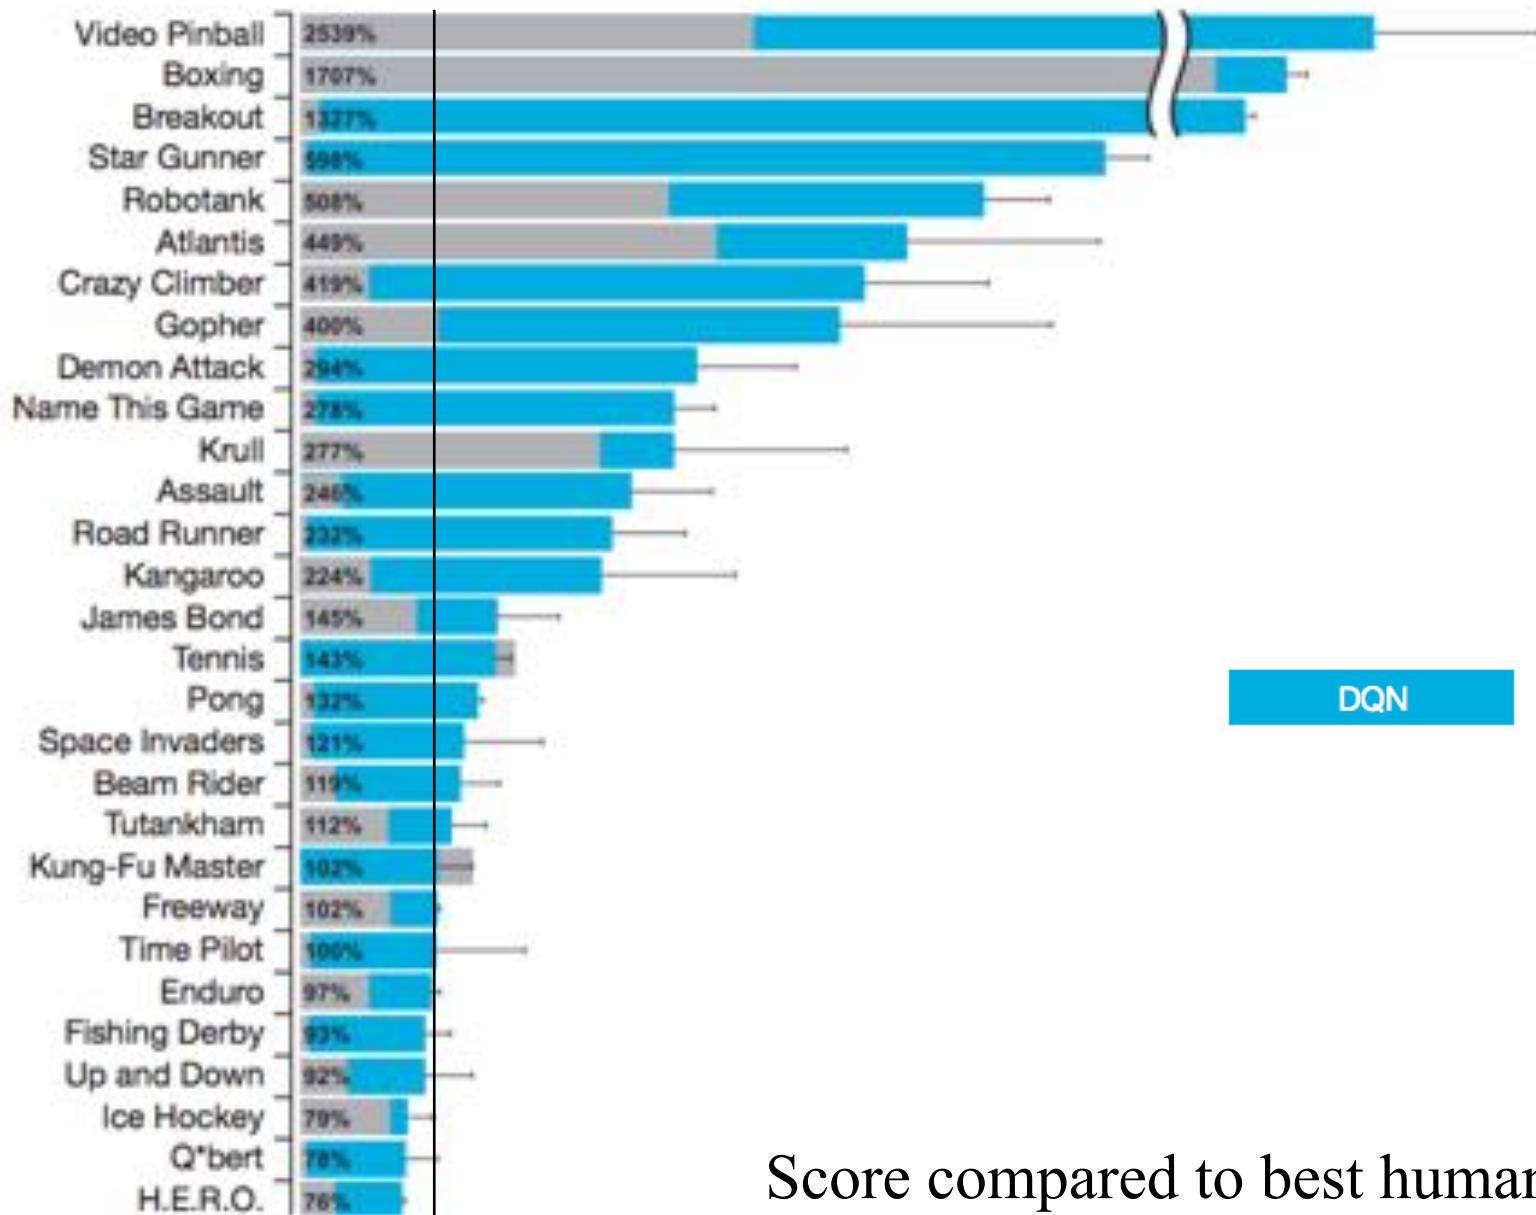

R is a reward and A_i is a legal action

Input is a representation of current state (S)

Interpret outputs as expected reward for a given action
